V-SERIES COMBINATIONS

Master combination V-series padlocks are commonly found in institutional and educational environments. V-series padlocks have a key override, which allows an individual with a properly cut key to open the padlock by overriding the user's combination.

Front

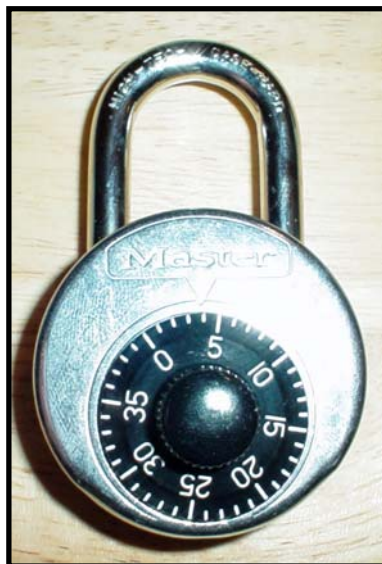

Serial Number

Back

Key Override

Part of the V-series, Master combination padlock models 2002 and 2010 are high security padlocks. The user dials the combination the same way as other Master combination padlocks, but after dialing the last number, turn the knob left until it stops. Then pull up on the shackle to open the lock.

X-SERIES COMBINATIONS

Below is an example of an X-series Master Lock combination padlock. X-series padlocks have knurled dials to assist with gripping. Knurled dials are also used on some A- and V-series padlocks. The letter X precedes the serial number, which is stamped on the back of the padlock. The serial number for the padlock below is X21782 with a matching combination of 18-04-34.

ADDITIONAL OPENING METHODS

There are additional surreptitious, covert, and forced entry methods for circumventing a Master Lock combination padlock if the serial number is not listed in this code book.

TRYOUT COMBINATIONS IF 3RD NUMBER IS KNOWN

Master Lock combination padlocks open using a three number combination, i.e. 10-20-30. If the 1st and 2nd numbers are unknown but the 3rd number is known, then the user may run a series of tryout combinations to recover the combination and open the padlock. There are 64 tryout combinations for each possible 3rd combination number.

The 3rd number is 00.

SHIMMING A MASTER LOCK COMBINATION PADLOCK

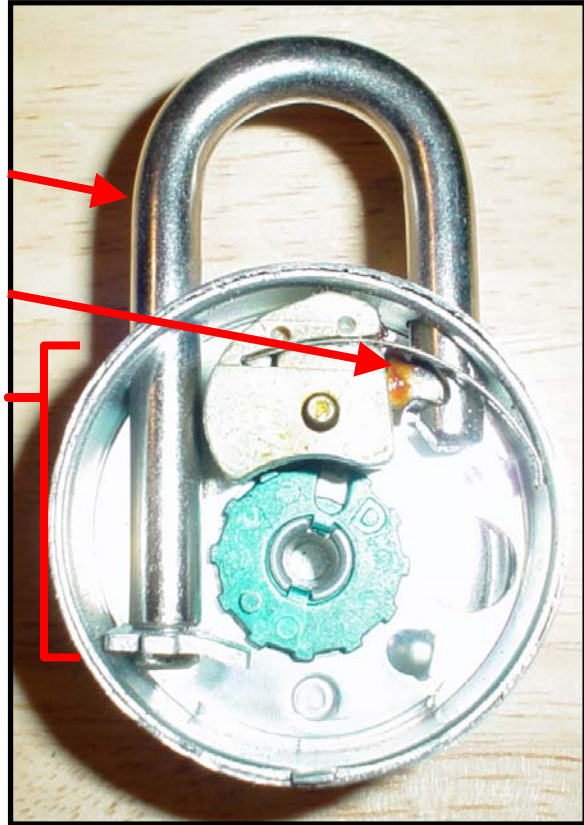

On the right is a picture of a Master Lock combination padlock with the back cover removed.

The shackle is the loop-shaped part of the padlock that does the fastening.

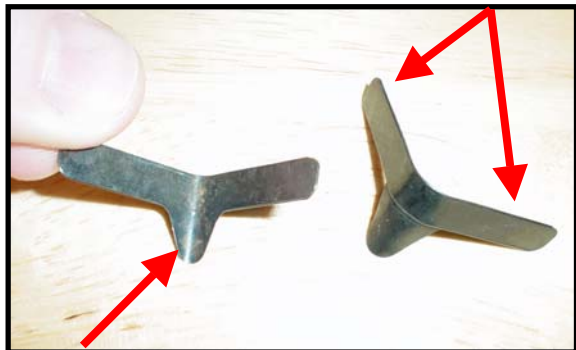

The bolt is the spring-loaded mechanism that engages the shackle.

The casing is the housing for the lock mechanism.

When the correct combination is dialed, the bolt is retracted from the shackle allowing the shackle to be pulled up and out of the casing.

**Shim Handles**

A padlock shim is a triangular piece of thin flat metal or plastic capable of being inserted into a narrow or tight space in order to push back the padlock's bolt. Padlock shims come in a variety of sizes.

**Shim Tip**

Most Master Lock combination padlocks are vulnerable to shimming. However, manufacturing changes over the years have led to closer tolerances between the padlock's case, shackle and bolt making shimming more difficult.

First, fully insert the tip of the shim along the side of the shackle as shown here.

Do not insert the padlock shim directly above the bolt. This will result in damage to the shim

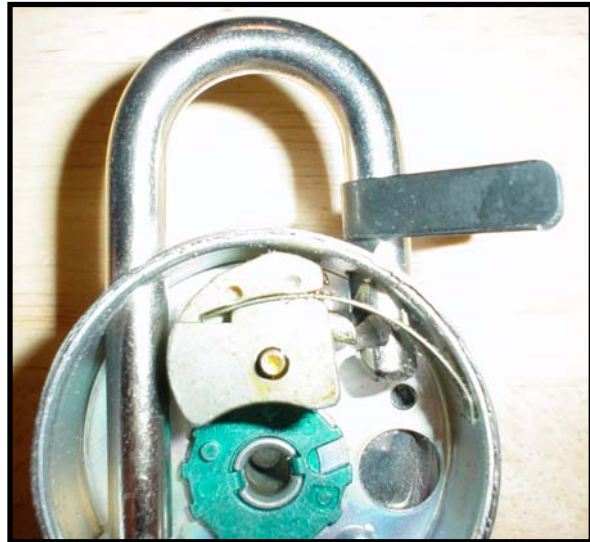

If the tolerances between the shackle and casing are too tight, try pushing the shackle towards one side of the padlock to create a space for the shim.

Next, the shim is slowly turned 90° toward the bolt with the shim handles facing outward. The shim may have to be worked back and forth in order to fully turn and retract the bolt.

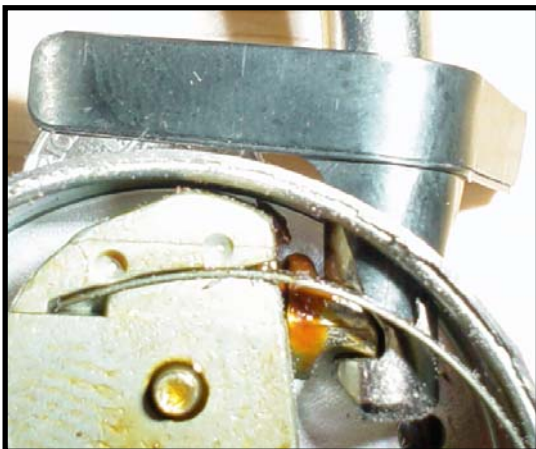

With nothing securing the shackle, it may be pulled up and out of the casing.

Below are two close-up views of the bolt in the locked and unlocked position.

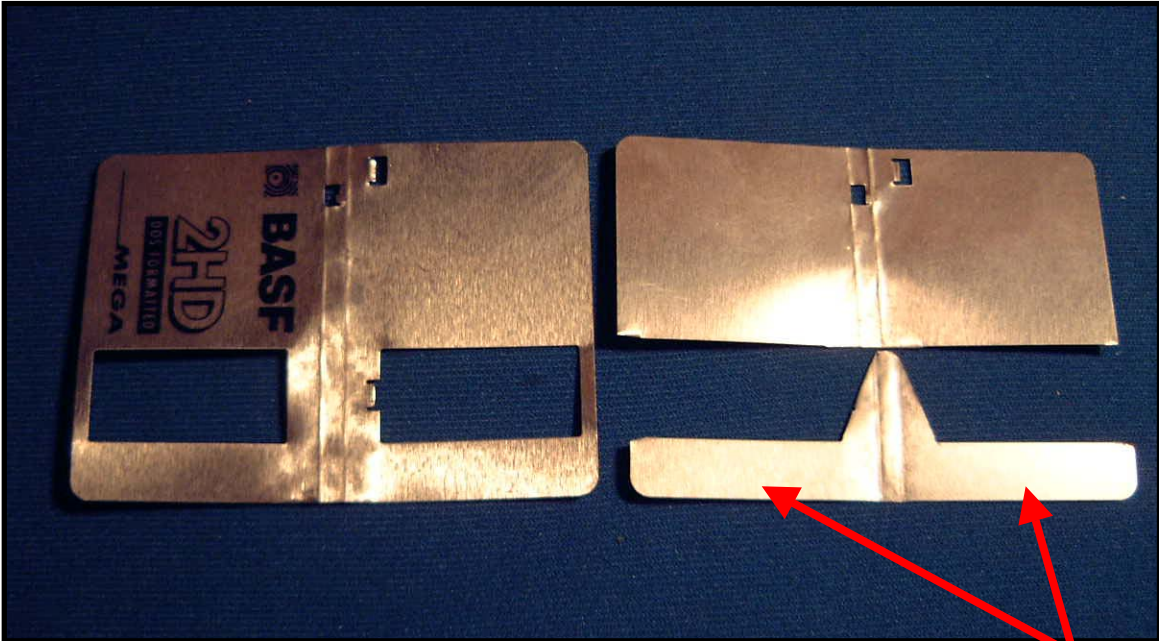

Locked – Bolt Extended/Shim Inserted.

Unlocked – Bolt Retracted/Shim Turned.

If a professionally made padlock shim is not available, one may be created from the metal shutter of a floppy disk. A pair of scissors is needed to cut the shim out.

This field expedient shim typically works on worn or older combination padlocks.
