What Will The 1990's Bring?

As we prepare to celebrate the holidays, the first year of a new decade is swiftly drawing to a close. The sixties was a decade of rebellion and change. The seventies is known as a decade in which people became disillusioned with government as Watergate rocked the nation. The eighties have come to be known as the "Yuppie Years," in which people were concerned with "Me first," and "Looking out for number one."

What will the 1990's bring us? This first year has been a difficult one in many aspects. As I write this *Commentary*, over 200,000 young Americans are camped in the sands of Saudi Arabia. Another 200,000 are on the way. At any moment they may be called upon to sacrifice their lives. All this because one man...one dangerous, evil lunatic...invaded a small country bordering his own,

As the final days of 1990 wind down, America finds herself poised on the brink of war. I do not know if this nation is prepared to watch film at eleven of our young people coming home in body bags. For that matter, I'm not even sure that I am prepared to watch it. We are all waiting, hoping that this situation will be resolved soon, and without further loss of life. (Remember that some American service people have already lost their lives in the desert during training accidents.)

1990 has been a difficult year when it comes to economics too. Even our president seems confused. "Read my lips. No new taxes!" has turned into, "Read my lips. You will know new taxes!" Are we in a recession? I don't know, other than to say that many businesses are slower than normal, and people seem afraid to make major buying decisions.

As a locksmith, there is not a whole lot you can do right now about Iraq. You alone cannot force the president and the Congress to reduce the budget. You cannot change the economy of this entire nation.

However, you as a locksmith, can have a big impact on the success of your own locksmith business. It used to be easy enough to let the business come to you. The calls simply came in based on your phone book ad. Customers just walked in the door. Now, however, you should be thinking about how to better market your products and services to the public. If you sit around waiting for the phone to ring you will not be helping yourself much at all.

Get out of the shop and speak with your commercial accounts. Meet with the consumers in your area. Offer to work with local homeowner's associations to conduct free security surveys. Make appointments with the management of nearby apartment complexes and motels. In fact, make it your business to *improve your business*. By becoming more visible, by contacting more potential customers, you will take an active role in improving your own economy.

Yes, 1990 will be finished in just a matter of a few days. Soon we will have the opportunity to make what we will of 1991. And perhaps some time in the future, people will be looking back fondly at the 1990's remembering a simpler and happier decade. What is the locksmith's role in the grand scheme of things? Simple. Protect and secure the lives and property of the public. That has been your role even before 1929 when *The National Locksmith* published its first issue. And it will continue to be your role for many decades hence.

Letters

Comments, Suggestions and Criticisms

The National Locksmith is interested in your view. We do reserve the right to edit for clarity and length. Please address your comments, praise, or criticism to Editor, The National Locksmith, 1533 Burgundy Parkway, Streamwood, IL 60107, All letters to the editor must be signed.

Grieving Family Thanks Trade Community

Dear Marc:

The family of Richard Middleton and Bell's Security Sales wish to thank everyone for their support, prayers, cards, flowers, donations to The Richard Middleton Memorial Fund, and countless expressions of sympathy.

Although Richard was with us for only a short time, he touched many peoples' lives. The respect and love he was shown while saying our final farewell, made this most difficult task a little easier. His life did leave its mark on this world—a thought that will help ease the void left in our hearts and lives by the loss of a husband, father and friend.

Again, our most sincere thanks. Magdelena (Dale), Richard II and

> Debra New Jersey

Editor's Note: Rich Middleton was a personal friend of mine. He helped break me into this business when I was all of 23 years old. We'll miss you Rich.

Confused Reader Questions Picture

Dear Marc:

In the October 1990 issue I am interested in Jack Roberts' article, "Key Blank Confusion," and am really confused by the picture on page 24, upper left, "2. The Dominion Line." Is it levitation that keeps those boxes in place?

Robert Ganhan Arizona

Editor's Note: Well it isn't levitation (or voodoo either)! Chalk it up to an upside down photo. Or maybe the photo is OKbut the rest of the magazine is upside down. I wonder...

Tradesman Advises Inexperienced Reader

Dear Marc:

I must take exception with the letter written by a young Darrin Wicker of California in the September 1990 issue. While what he states about collective advertising could be an asset to the locksmith profession, putting it into operation might be a fruitless, frustrating undertaking.

I cannot agree or disagree with Mr. Wicker's description of how poorly locksmiths may treat their public, the locksmith's source of income. I can only state that I feel if a barber, salesman or indeed a locksmith has a tendency to treat his customer poorly, no doubt the customer will be lost to

future business. It is inconceivable that anyone would knowingly attempt to propagate their business in this way.

Now on to the other item. While I applaud the fact that Mr. Wicker is in operation 24 hours a day, seven days a week, I feel this is common in our industry. Of course most experienced locksmiths/business people would decline to open that many hours because of the negative financial and practical aspects of such hours. I am confident most of our fellow locksmiths are available on call for emergencies 24 hours a day.

To make a service call to cut five keys, sans trip charge or service call charge is relegating our profession backward to the handyman/fix-it specialist from which we have attempted to advance our public image. By doing this, I do not feel Mr. Wicker is doing anything positive toward regaining any possible lost sales to hardware stores, etc. But, rather, it is more like operating a mobile hardware store. There will always be those retailers who will sell items of lesser quality than a locksmith for a lower price. But, the locksmith has a lot more to offer the public, and in doing so should be paid on a professional scale.

After all is said and done, one might expect a hardware clerk to charge less money based on his lack of investment in education, equipment, experience and knowledge. But a locksmith is a far cry from a clerk and as such not only deserves the status of a professional, but

ASP - Your Auto Service Center for the World

should also command a price commensurate with his/her professional

As Mr. Wicker gets some more experience under his belt, I am confident he will awaken to the reality of our industry being on a much higher level than he now believes.

> Bill Ferguson Pennsylvania

Locksmith Gives Practical Advice

Dear Mare:

I'd like to respond to a letter in the September issue by Darrin Wicker of California. I want to help him "understand the attitudes of his fellow locksmiths."

Darrin, you stated that you just started your business. This is painfully obvious. You have a lot to learn. Here is your first lesson, and it's free. Weight lifters compete with weight lifters. Runners compete with runners. And non-professionals compete with nonprofessionals. If you want to compete with tow truck drivers and hardware stores, buy a tow truck and open a hardware store. Don't cut the throats of your fellow locksmiths with nonprofessional prices. I don't know about you, but most of us want to do more than just "pay the bills."

Fast is one thing. Cheap, on the other hand, is not something to brag about. Would you take your child to a certain doctor because he's cheap? I

I too, want all the business I can get, but I'm not going to degrade myself and my profession by charging cut-rate prices on providing free on-site key cutting. You may be gaining a customer following, but you find, in the long run, that you're better off without a customer who expects something for

Lesson number two: Don't waste your money on television, radio, or newspaper ads. Trust me. I learned this very expensive lesson the hard way when I started my own company. I signed a 13 week contract at a \$32.50 a week, in a community type newspaper and got two small jobs as a result of the ads. I even offered coupons. (They don't work either.) I did, however, get dozens of calls from other small newspapers, wanting me to advertise with them.

Newspaper advertising and the like, are for products and services that people plan and shop for. People usually don't plan to call a locksmith.

When people need a locksmith, especially for the first time, they usually grab the closest yellow pages.

So you don't miss the next deadline, I suggest you call your yellow pages representative and set up an appointment today. The figures sound scary when you're "new," but believe me, a well worded yellow page ad will more than pay for itself every month.

Just don't go crazy at first.

Start out with an "in-column listing" or at the most, a small display ad, and see how things go. A good representative will also tell you this. They want you to do well, so you'll get a bigger ad next year. However, some representatives who are not so good, will try to sell you the biggest ad they can, just to get that commission. Be careful! You, and only you, know what you can handle.

Once you start playing the yellow pages game, you will quickly realize why you can't charge \$30 to go out and open a car, or \$5 to rekey a cylinder, and still turn a healthy profit. And that, my young friend, is what it's all about.

If I'm coming off as a "super being" forgive me. I just feel that if you are going to call yourself a locksmith, don't be a non-professional one. Be one of us, not one of them.

We have it all. Quality, Value, & Service.

You'll be surprised how many established locksmiths will help out a new guy, but not if they know that he's the one who's been cutting their prices. Nobody likes a cutthroat.

Compete with professionals. Then, and only then, will you truly "understand the attitudes of your fellow locksmiths."

> Bobby De Weese Maryland

Change Fast & Cheap To Prompt & Profitable

Dear Mare:

In reference to Darrin Wicker's letter in the September issue, the advice I give Darrin is to save your own letter for future reference when you look for reasons why you are not in the locksmithing profession. Also take a course in business administration from your local school or community college.

Clint Eastwood once said, "You've got to know your own limitations." It seems that you have set your limitations to work for less than \$4.25 an hour, 24 hours a day, seven days a week to provide free service with negative profit potential to compete with tow truck drivers and hardware stores. You will succeed in doing just that, but unless you are independently wealthy, time is not on your side.

I agree you are not making a profit, but you are also not promoting the locksmith profession. You are instead promoting "fast and cheap" in direct competition with tow drivers and hardware store. When you establish your following for "fast and cheap" and realize you cannot stay in business unless you change to "prompt and profit," you will lose 85% of your following for "fast and cheap."

Raise your standards above tow truck drivers and hardware stores by furthering your education in locksmithing to enable yourself to provide the products and services that tow truck drivers and hardware stores cannot provide. Provide these at a profit so you can combine your education to remain up-to-date and competitive with your fellow locksmiths, and you will succeed.

William Borner Pennsylvania

Council Informs Readers Of Polystyrene Recycling Dear Marc:

A letter from the Green Mountain

Locksmiths Association in your August issue notes their decision to protest the use of non-degradable packaging materials in shipments by suppliers of the locksmith trade. Polystyrene "peanuts" were specifically mentioned.

In consumers' quests for "environmentally-friendly" packaging, we submit that polystyrene is a logical and sound choice. It is much more lightweight than shredded paper and protects materials better in shipment. True, polystyrene is not degradable. But in a landfill, where air and water needed for decomposition are lacking, paper degrades very slowly, if at all. Paper accounts for 40 or more percent of

landfill contents; polystyrene occupies less than one percent.

We realize, however, that even if one percent should be diverted from a landfill if it can be recycled. And polystyrene can be recycled. The Plastics Again facility in the association's neighboring state of Massachusetts is recycling polystyrene from a variety of suppliers, including the 450 McDonald's restaurants of New England. Additional facilities are opening around the country, and we expect more than a half-dozen large-scale plants to be open by year's end.

We are excited about our fledgling efforts to take used polystyrene and

Alternative Magazine Wrapping Suggested

Dear Mare:

As a media planner for a mid-size advertising agency, I receive anywhere from 25 to 30 publications daily, including *The National Locksmith*.

I have begun contacting editors and publishers of those publications, including yours, which mail the magazines in a plastic/poly bag wrapper. I request that they consider mailing their publications either with an address label affixed to the corner, or in a recyclable paper envelope.

My concern is purely environmental. In most instances, the plastic wrapper appears superfluous, and when discarded, unnecessarily clogs landfills.

Robert G. Kliesch, publisher of Architecture Magazine, has recently announced that his publication will discontinue mailing in plastic wrappers effective January 1991, due largely to the complaints of readers whose environmental concerns he "cannot effectively argue against."

I would appreciate you following the enlightened lead of Mr. Kliesch and Architecture Magazine by considering environmentally-conscious alternatives to mailing your publications in plastic wrappers. The environment would benefit, and in turn, so would we all.

Thank you for your time and consideration,

Linda Simeone Media Planner The Capener Company California

Editor's Note: Sorry Linda, but ours is a magazine containing sensitive security information which must be shielded from prying eyes, But from an environmental point of view, it is interesting to note that very few copies of The National Locksmith ever wind up in landfills. Our research shows that well over 90% of our subscribers save their issues for future reference. Very few magazines can make that claim,

In Memory Of Richard Middleton

Richard Middleton, age 46, passed away suddenly on September 17, 1990, while on a Hawaiian Cruise celebrating his 25th Wedding Anniversary.

Richard was an active member of the Associated Locksmiths of America, Inc. (ALOA), The Master Locksmiths Association of New Jersey (MLANJ), Door and Hardware Institute (DHI) and The National Locksmith Suppliers Association (NLSA).

Richard graduated Hillside High School, Hillside, N.J. and attended Usala College.

Richard started out his mobile shop in 1965 as Hillside Lockshop. From 1968 to present (22 years) he owned Bell's Security Sales, Inc., Bloomfield, N.J.

Richard's opinion was highly respected and requested both by the locksmith and manufacturing communities. His knowledge of the needs of the locksmith was unique. He was constantly striving to have products manufactured to meet these needs and brought back new products and knowledge from the manufacturers to be introduced to the locksmiths.

As a living tribute to Richard's memory, a scholarship fund has been established: The Richard Middleton Memorial Fund, c/o The Master Locksmith Assoc. of NJ, P.O. Box 2441, Morristown, NJ 07960. This scholarship fund will afford the opportunity for apprentice locksmiths to learn the trade Richard so loved. Through these young men and women, Richard will always be with us.

Richard II who has worked with his father for the past 8 years, along with the "extended family" of Bell's Security Sales, Inc. will continue to provide the same quality service in the same tradition as in the past 22 years.

Technitips

Helpful Hints from Fellow Locksmiths

Send me your Technitips. Who knows, you may be our next winner! c/o The National Locksmith, 1533 Burgundy Parkway. Streamwood, It, 60107.

by Robert Sieveking

Congratulations to all those who find their Technitips printed this month. This has been a busy month and time was short, but it is always a pleasure to read the Tips of fellow locksmiths. The volume and quality of responses to this column has been tremendous. Thank you, all, for your participation and support. The last grains of sand slowly sift from the hourglass, as the fantastically successful year of 1990 slips into history.

With the end of 1990 comes the beginning of a completely new Technitips contest year. If your year was half as busy as mine, I can understand why you didn't find the time to get that fantastic Technitip that you've been talking about into print. Hey, you got another chance. Make a

Win a VATS Decoder From All-Lock!

Each month, All-Lock will award one of their A-7000 VATS Decoders to the best automotive Technitip submitted this month. If you would like a chance to win a free decoder from All-Lock, simply submit your automotive tip exclusively to The National Locksmith. Tips submitted to other publications cannot be considered.

All-Lock's A-7000 makes it easy to diagnose system failures, service the column and select the correct key blank. This sophisticated tool is easy to use and is completely portable. Long wire leads are easy to use in cramped automotive situations.

Submit your tip, and win today!

take a moment to remember the true significance of the holidays. Happy Holidays.

New Years resolution to submit at least one Technitip in 1991. Winners will be chosen from those who enter. Losers are self selected throughout the year. Why would you chose to be a loser, when it's so easy to win? Send your Tip to the best locksmith publication in the industry. But get it in the mail soon. You only have twelve months 'til the '91 contest ends.

As you enjoy the holiday season,

December's Best Tip

Many times we are called on to install a simple "throw bolt," that has a turn button on the inside and no lock cylinder or access from the outside. This lock function is commercially available from most manufacturers, but

How To Enter

All you need to do to enter is submit a tip, covering any aspect of locksmithing to The National Locksmith. Certainly, you have a favorite way of doing things that you'd like to share with other locksmiths. Why not wirite it down and submit it to:Robert Sieveking, Technitips' Editor, The National Locksmith, 1533 Burgundy Parkway, Streamwood, Il 60107.

Tips submitted to other industry publications will not be eligible! So get busy and send in your tips today. You may win cash merchandise, or even one of many key machines or code book sets! At the end of the year, we choose the winners of the listed prizes.

Last year dozens of people walked off with money and prizes. Wouldn't you like to be one of the prize winners for 1990? Enter today! It's a lot easier than you think!

Every Tip Wins 'Locksmith Bucks!'

Yes, every tip published wins a prize. But remember, you must submit your tip to *The National Locksmith* exclusively. Each and every tip published in Technitips wins you \$25.00 in Locksmith Bucks! Use this spendable cash toward the purchase of any books or merchandise from *The National Locksmith*. You also receive a Bonded Locksmith bumper sticker, decal and patch. Plus you are now eligible for the really big prizes!

Best Tip of the month prizes!

If your tip is chosen as the best tip of the month, you will win \$50.00 in cash as well as \$35.00 in Locksmith Bucks! Plus you will receive a quartz Locksmith watch, a Bonded Locksmith bumper sticker, decal, patch and a Locksmith Cap. Plus, you may win one of the annual prizes.

could be tightened against the lock retaining clip. The clip retaining screw "locks" the clip into the puller block, until you release its grip. By preventing the clip from slipping out of the puller, you greatly enhance the overall performance of the tool.

> Thomas Rucker Ohio

Here's a little Tip that will improve the security of most lock installations and can even be used to increase the profitability of your rekey jobs every day. When installing locksets or deadbolts that have a standard duty strike, suggest that extra length security

screws be installed to increase the strength of the installation. Substitute flat head #8 x 2" brass wood screws for the 3/4" screws supplied with most lockset strikes. For deadbolt strikes, larger screws may be in order.

On rekey jobs, the added service offered to increase the lock's security will show your customer that you care about their security. Don't forget to drill pilot holes in the jamb, to prevent splitting of the wood. This is especially important on those hard oak door frames.

William Frase Delaware

I was told that the V.A.T.S. equipped autos for 1991 would have a new "C" keyway, so I went down to the local Cadillac dealer and did a little checking on this rumor. A careful inspection revealed that the "A" keyway was still being used on the '91 models. The door key, however, was an "H" keyway. If the keyway is changed from the present "A" keyway, the easiest solution to a lost key would be to replace the ignition with one using an "A" keyway. As long as the body of the ignition stays the same, the V.A.T.S. resistances should be compatible with all previous systems. This Technitip eliminates the necessity of stocking a second complete set of very expensive blanks.

Juanita Ramsey Texas

Editors Note: I checked around, concerning the possibility of a new VATS keyway. I would not expect to see another keyway during the '91 model year, but who knows. If you see a VATS "C" keyway, you'll know it because your "A" keys won't fit. This Technitip should easily cover your emergency. By the way, it is my understanding that the GM "silver medallion service" will furnish replacement keys to the original purchaser at "no charge." Just in case you think there is a real big market for these keys.

My research, though, did turn up some very interesting and helpful information concerning VATS servicing.

1. After the 1989 model year, the #1 pellet will be discontinued. (The resistance value #1.)

 When interrogating an auto for the proper resistance value, try values #11, then #4, and then #9 first.

In the order of frequency of use, the #11 value is most common, #4 is second most frequently used, and #9 is the third most popular value.

 Low battery is the most common cause of failure to start on VATS equipped autos. The battery must be fully charged for the system to operate.

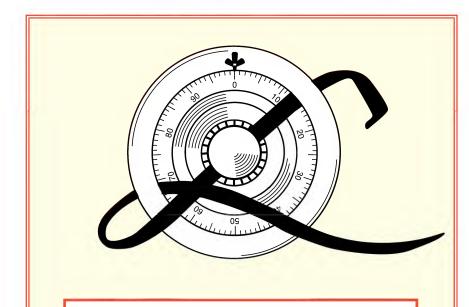

4. Hollines for VATS codes.

(Oh, you thought nobody in the world could find a VATS code without a decoder. That's what they wanted you to think.)

Cadillac 1-800-882-1112 , 24 hours. Oldsmobile 1-800-242-6537 , 24 hours.

Buick -800-252-1112, 24 hours. Pontiac 1-800-762-3743, 24 hours. Chevrolet 1-800-527-7546, 24 hours.

Corvette 1-502-745-8101 6 a.m. - 3 p.m.

Lockmasters
has a 44
year history
of training
security
professionals.

(You will need the VIN number, make, model and the owner to get the code. I don't think these hot lines were intended for locksmiths.)

5. Hair oil or grease on the VATS pellet or reader contacts will cause the system to fail. Clean the pellet or contacts to restore the system.

6. "VATS I" ignitions can be identified by the "black" wire to the switch. They were used in '86 and '87. These ignitions accommodate the shorter VATS key. VATS ignitions using a "yellow" connection wire are "VATS II," manufactured during 1988 and later, and require the longer VATS key. VATS II keys are 3mm longer from the head to the shoulder. (There was a program to turn intexchange your shorter keys to B&S for the new longer keys at no charge, about two years ago. I didn't hear about it until it was over. Did any locksmiths participate in this program?)

It is my feeling that simplicity is the key to any successful mechanism. Hightech is great, as long as it's working. But, when it fails, you have a real problem, because nobody really knows how it works. Information concerning the VATS "security" systems is understandably hard to find. I hope these points will be of assistance to you

all. Pay special attention to item #2 above.

My Technitip concerns working on GM locks, but can be used on any vehicle. Many times the customer that loses his keys one time, calls again with the same problem. Because of the time involved in disassembling and assembling the locks, it would be a helpful to have the codes easily available for the second service opportunity. Many times, replacement ignitions do not have codes stamped on the outside of the lock case. My Tip is to engrave the lock code on all new ignitions, when they are installed. If you disassemble an ignition to make a key, engrave the key cuts on the lock body. This Tip will save you, or a fellow locksmith, a little time if the key is lost again.

For security reasons, it may not be a good idea to leave an ignition or door code in the glove box or behind the horn pad where it could easily be found. You will want to convert the auto codes (or cuts) to a letter code or cypher of your own design. This will prevent the key codes from being used by other than yourself.

Ron Nayda New Jersey This Technitip concerns opening the 1990 Ford Aerostar Van. Attack the slide window lock rather than the door lock linkage. A wedge can be used at the rear of the window, but is not absolutely necessary. Insert a "Z" type tool at the rear of the slide window and hook the forward side of the window lock. Pull straight back, to disengage the plastic lock and free the window. Remove the tool and slide the window open to unlock the door. I have had good luck with this opening method, but advise caution when wedging or working around the glass with metal

tools. You don't want to scratch the

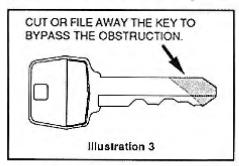

glass or window tinting material. Byron W. Cordes II Oregon

My Tip concerns the Ford pin type ignitions. It is fairly common to have the key alarm switch contact at the front of the lock, break off and fall to the rear of the keyway. This prevents the key from being fully inserted into the plug, or turned to the "on" position. In those cases, when you find it impossible to remove the broken piece by normal methods, I would offer this simple solution.

Installation Tools
The Professionals Choice

Illustration three shows a Ford key that has been cut away to bypass the obstruction in the keyway. Duplicate

the customer's key onto one side of a new blank, as you see. Then file or cut away the tip of the key, leaving the bitting portion of the key to operate the pins. Be careful not to remove the last cut, at the tip of the key. In most cases, this special key will allow you to turn the ignition to the "on" position to depress the cylinder retainer and remove the ignition for replacement or repair.

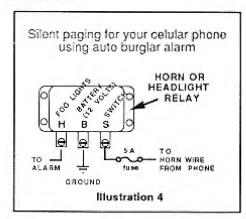

Walt Dunaway Arizona

An ignition key can be easily made for the '86 and newer Mercedes Benz trucks by fitting a key to the door cylinder. Remove two phillips head

screws that secure the lock in the door, and remove the cylinder to fit the key. These vehicles use X-82 or X-83 key blanks. The ignition and door locks are keyed alike.

John Mussell Idaho

If you have a cellular phone with a horn option and a silent burglar alarm on your truck, you can easily combine the two, to allow the phone to trigger the silent alarm/pager of the auto alarm. If a call is received while you are away from your truck, the pager will beep you, to let you know you have a call. The beeper is much more desirable in most cases, than the blasting of your truck horn.

The Tip, shown in illustration four, is to use an isolation relay, like those used to connect auxiliary fog or driving lights. My relay was marked as shown in the illustration. The alarm and horn wires were connected to the relay as you see. The phone wire supplies 12V to the relay when a call is received. The relay, then supplies a ground to the alarm, activating the alarm and signalling the pager. This type of phone signal is especially useful when you are inside a building, where you can not hear the truck horn.

A second Tip which I have used is to paint the tips of my car opening tools with fluorescent orange paint. This makes them easier to follow when trying to locate the linkage inside a door using the flex light. The tip of the tool stands out in the dim light, to make placing it over the linkage much easier

> R. Lazich Wisconsin

This Technitip is for the Dodge Omni and Plymouth Horizon and possibly other Chrysler products. The Tip works especially well when the key is broken off, upside down, in the ignition lock. When the normal key extractor fails to retrieve the broken piece in the first few minutes, try this

The market leader in locking systems for security, safety, and control.

Tip.

Remove the four phillips screws that cure the bottom column cover. Remove the cover and find the key farm buzzer actuator switch under the unition lock. It is secured by one phillips screw. Remove the screw and from the switch away from the column respose the switch actuator arm (part in the ignition lock). The arm will retrude slightly, because the key is still the keyway.

Using an ice pick, scratch the broken key out the front of the ignition lock. This should only take a second once you spot the opening in the bottom of the ignition lock. Reassemble the key plarm switch and replace the bottom folumn cover to complete the job. The whole job should not take more than live minutes. I've found this method asier than working through the leaves.

Kenny Hammack Indiana

I have a customer that I masterkey take for frequently. Sometimes I install to locks and sometimes I only do the reging work. The customer has a bad habit of moving the locks from one door number to another, shuffling the locks around to avoid the expense of having them recombinated. The problem of keeping track of change tays for the locks is monumental. My Technitip is to write the "code" for the tack cylinders, right on the cylinder.

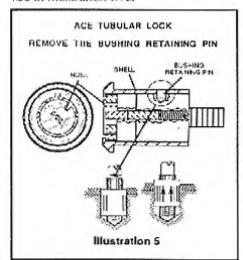

By using a "Sharpie" permanent narking pen, the numbers will not rub if the metal cylinder body or become ost. When the customer brings in a ylinder that has the change key lost, all nave to do is cut a new key to code. This saves the time wasted in disassembling the cylinder to decode to pins.

When I recombinate a cylinder to a rew key, I know exactly what key combination to delete from my master chart. This way I know which combinations are in use and which have been removed from service.

A second Technitip, that I used recently to solve a Steelease desk ockout may be of interest to your vaders. The customer had a steel case lesk with a tubular lock in the center drawer. The wrong key had been serted into the lock and somehow arned two positions in the opening frection. The key stopped there, and would not turn far enough to open the nesk and could not be rotated back to

remove the key. Bypassing the desk linkage was not difficult, but the lock remained in a position that would not budge to release the key.

To save the key and the lock this is my tip. Remove the lock from the drawer. Carefully centerpunch and drill through the bushing retaining pin with a #46 drill. (.0785".) This is the tap drill size for a 3-48 screw. Tap the bushing retaining pin, using a 3-48 screw as you see in illustration five.

The tap will pass through the retaining pin and bottom in the blind hole. As the tap is further rotated, the pin will rise up out of the hole, just like magic. Turn the tap until the pin is ejected from its hole The same retaining pin can be used to fasten the bushing after the job is complete. (At this point, the cam and cam retaining nut should still be on the lock cylinder, to retain the bushing in the lock, otherwise the top pins and springs should be allowed to escape as the bushing separated from the rotating bushing of the lock.)

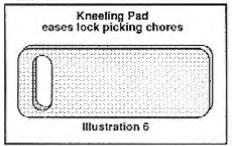

With the retaining pin removed, the cylinder can be rotated to the key removal position and the wrong key removed from the lock. Insert the correct key and rotate the cylinder back to the position where the retaining key was removed.

Reinstall the retaining pin, rotate the key back to the keypull (key removal) position and remove the key. Install the lock back in the desk and check for proper operation to complete the job. No disassembly of the cylinder was required, and the lock was not damaged.

Larry Wright South Carolina

This Technitip is more "practical" then "technical" but it sure has made my job a lot easier since I started using it on the job.

I recently installed a Baldwin mortise lockset. Most of the installation time was spent on my knees, which left them sore. The day continued with a job repairing an automotive lock in a gravel parking lot and a pick to open job on a wet concrete floor. I was spending more time on my knees than a shoe salesman. The next day, I went to my local garden shop and purchased a foam kneeling pad, like the one shown in illustration six. I've used it every since. No more soggy or sore knees here.

My Technitip is to keep a kneeling pad in the van for those long installations, auto or picking jobs that can really kill your knees.

> Keith Smith Pennsylvania

If you go on a call to repair the ignition of a Camaro or Firebird with a floor shift (also '82-up Cutless or equivalent GM body style) and you find that the lock works fine but cannot be turned back to the off and accessory positions, try this Tip.

There is a cable that runs from the console shifter up to the "electrical switch" mounted on the lower part of the column, near the floor. Drop the column if necessary to remove the switch from the column. The lock can then be turned to the off/acc, positions. The problem is in the interlock which the cable performs on the electrical switch. The transmission must be placed in the "park" position before the key can be turned to "off" and removed. This interlock performs a safety function. It prevents the ignition from heing turned off or the steering wheel from being locked while the car is in motion.

The only correct solution is to replace the ignition switch or cable assembly. A temporary repair would be to disconnect the cable at the switch, but you must instruct the customer to have the switch replaced immediately to preserve the safety function.

McGunn Safe's Cash Handler IV

In two tests, the new patented McGunn Cash Handler IV's door resisted attacks with a ten pound sledge hammer more than two times longer than the nearest class competitor. The fourth generation Cash Handler's full length, solid steel, machined L-shape, strike bars which are continuously welded to the side panels give the safe its extra measure of strength.

The time delay access safe also features fish-proof double-baffle, color-coded, cash drop slot drawers with matching envelopes. Computer interface capability allow better cash control, inventory control and employee theft detection. Time delay access safes are used in business to protect cash or other valuables and prevent robberies and employee theft.

Corby Announces 1991 Calendar

For the third consecutive year Corby Industries, Inc. is again offering security dealers and installers a new, 1991 limited edition, 17" x 11" glamour calendar. The Allentown based access control manufacturer is currently providing over 50,000 copies to their distributors worldwide.

This year's calendar is unique because for the first time, both sides of the calendar were printed and provide collectors a choice between a vertical or horizontal pose of Amy Anderson, Corby's current calendar model.

The 16 month glossy calendar is available at all Corby's authorized distributor branch locations, or it can be ordered direct from Corby.

"O" Bitted Cylinders From Schlage Lock

Schlage Lock Company has announced that "O" bitting or "1" bitting will be furnished with "O" bitted cylinders. Previously, Schlage furnished "1" bitting exclusively:

The "O" bitted cylinders will be furnished with "O" bottom pins. The bottom pins will be inserted upside down in the chambers. By furnishing "O" bitted cylinders, customers will benefit since this allows zero cuts on key blanks. To disassemble, you simply insert the key blank and rotate the cylinder plug. In addition, two key blanks will be furnished with each cylinder, thereby, the keys can be made from the blanks.

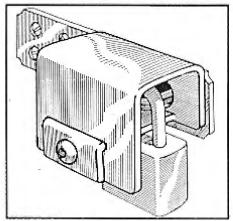

The cylinder bodies will have number 3 top pins in all of the chambers. To simplify the rekeying and disassembly of mortise cylinders "O" bitted, the cylinder cam and screws will not be installed. They will be packaged in the cylinder box.

H&H Lock Supplies Armadillo Bar

The Armadillo combination window bar is a removable/screwless unit available from H&H Lock Security Wholesalers

To use, simply position the bar in the jamb of the window, and mark where the pegs hit the jamb. Drill a 5/8" diameter hole and expand the bar so that the pegs enter the drilled holes. Drill a hole in the flat crossbar to accommodate the padlock shackle. The padlock will prevent the bar from collapsing.

The Armadillo combination window bar may also be installed surface or flush mounted as desired with the necessary fasteners. The pegs may be removed if desired. A surface kit is available if required.

1991 Locksmith Directory

This Directory contains the names, addresses, and phone numbers for the hundreds of manufacturers and distributors serving the locksmith industry. Each company has been given the opportunity to write a short paragraph about themselves. This gives you a chance to learn more about the various companies in the industry.

Save this issue for reference throughout the year of 1991. If you ever have a question, problem, order or a comment to make, you can use this Locksmith Directory to help you get results. Remember, these compaines exist to help you, the locksmith. But they cannot become more responsive to you if you do not keep in contact.

We have tried very hard to make this Locksmith Directory complete with all the information you might need during the upcoming year. However, it is possible that some information might have inadvertantly been omitted. If this is the case, then a future issue will contain an addendum to this list.

Make Sargent & Greenleaf's Comptronic locks your choice for electronic safe locking solutions.

Guest Editorial

by Jon Payne Chairman, Legislative Affairs Committee, ALOA

Previously, we printed an edited version of this Guest Editorial which Jon Payne has written regarding the locksmith federal registration proposal. Unfortunately, our editing seemed to have changed some of Jon's meanings. Therefore, in order to be sure his points of view are well understood, we are hereby reprinting the editorial in its original, unedited version.

This is in response to your Commentary opposing ALOA's proposal for a federal law to register locksmiths. I would like to take issue with most if not all of your Editorial.

First of all I would like to point out that ALOA is a member driven organization, and this idea is a result of member input, as well as input from other leaders in the industry. We did not just wake up one morning and decide to introduce this bill.

Secondly I would like to thank you for the opportunity to share our side of the issue, and for your consideration in attacking the message, not the messenger. ALOA deliberately informed the trade publications of this idea so that it can be debated openly in the industry. It if turns out to be a "really bad idea" as you say, then it will die a quick death. However the locksmiths of the nation will decide its fate, not you and I.

This proposed bill is simply one of locksmith registration, a locksmith permit if you will. To be a locksmith, and possess locksmith tools, a person would need to obtain a federal permit. You could not obtain a permit if you had ever been convicted of a felony or a crime involving an act of intentional dishonesty or moral turpitude in any court, unless officially pardoned.

As we all know, any person can become a locksmith in this country simply by deciding for themselves that they are one. Yet if you ask John Q. Public what it takes to become a locksmith many will respond that "you have to be checked out by the police." Reality is that this is not true. In fact, as

an employer, I know that it is virtually impossible to submit a potential employee to a police check as a qualification for employment. Yet if I unwittingly hire a "bad" locksmith, I could be sued if he committed an illegal act while in my employ. A real catch 22. So we can say that one benefit of this federal registration is that locksmith employers will have the peace of mind of knowing that employees are free of criminal convictions. A secondary benefit is that the public would have the peace of mind of knowing that the person changing their locks did not just get out of jail.

If you read the legislative bulletin in Keynotes each month, you will notice that there are many bills being introduced by other industries that are slowly eating away at the locksmith industry. The electrical contractors constantly introduce legislation that seeks to restrict non-electricians from doing any type of electrical work, such as burglar alarms and electric locks. The burglar alarm industry is equally as guilty in seeking to restrict others from installing burglar alarms. ALOA has found the industry to be at a significant disadvantage when we attempt to fight such legislation because our industry has virtually no licensing at all. So another benefit of the federal registration is that we would be able to modify or amend such encroaching legislation with the phrase "except licensed locksmiths." Federal registration would be a useful weapon in fighting unfriendly legislation.

There are many, many local locksmith associations around the country that are seeking to introduce local locksmith licensing laws. Perhaps your local association is among them. What are the reasons for this effort? Evidently, it is because the local associations see a need for it in their communities. As chairman of the legislative affairs committee, I see many such bills on a daily basis. I can tell you these state initiatives, while common in purpose, are radically different in content. This potential difference between state laws could

become quite confusing and very difficult to keep up with as time goes on. Since many locksmith companies and locksmith distributors operate across state boundaries or even nationally, they would have to devote a significant amount of time to insuring compliance with the state and local laws. This leads me to another benefit of the federal permit, that of uniformity. There would be little need for any state laws with a federal permit in place. One law would be easier to comply with than 50 different laws. Additionally, the local locksmith associations could abandon the often quite expensive task of pursuing the passage of local laws.

We frequently find locksmith licensing laws being introduced by non-locksmiths, some quite restrictive. It is impossible to generalize at the motivations behind these bills, except to say that the person introducing the bill perceived it as a solution to a problem. Frequently the industry is left with precious little time to react and overturn such detrimental legislation. So another benefit of the federal permit would be that the need for state laws would be minimal, since locksmiths would already be registered with a "higher authority" than the state government.

There is precedent at the state level, for this type of federal criminal background check approach, California requires that person must be clear of any misdemeanor conviction for three years or felony conviction for seven years to be eligible for a locksmith permit. There is also ample precedent in the law, both state and federal, for excluding felons from certain occupations as long as the conviction is relevant to the occupation. For example, a conviction of "drunk and disorderly" might not be considered when applying for a locksmith permit, while a conviction of "breaking and entering" would be considered. The latter is of course relevant to the occupation of locksmithing.

Now I would like to counter your specific points made in your editorial. You equated the ATF law, that prevents criminals from getting a license to sell

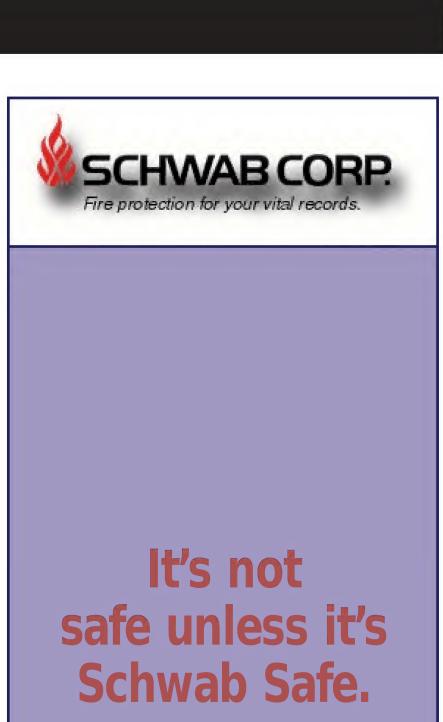

guns, to "gun control." The Bureau of Alcohol, Tobacco and Firearms, within the Treasury Department, has a system in place that checks criminal records at a federal or state level for retailers seeking a license to sell firearms. This 22 year old system is not designed as a gun control measure, but rather, seeks to eliminate criminals from the legitimate retail firearms industry.

You mentioned the medical profession's inability to get rid of "bad doctors.' This statement implies that any effort at self regulation is doomed to failure. I don't believe that and I don't think that intelligent locksmiths will believe it either. To use your example, imagine how bad things could become in the medical profession if there was no regulation at all.

Yes, there will be a fee for this registration. The ATF charges \$30.00 for a license to retail guns, the same price as a subscription to your fine magazine. Fees are necessary to pay for the costs of administering the program.

You cite "investigations" and "files" as an invasion of privacy. The "investigation" is a matter of accessing a computer to see if there is a criminal record. If there is not, then that is the end of it. If there is, then the "file" on the person already existed. This is the same procedure that you must go through in many states to purchase a hand gun. We all go through criminal checks, daily, in our lives and ALOA fails to see why this one would be bad for this industry.

ALOA recognizes that this a sensitive subject in our industry, but rather than "wishing" it away, we decided to confront it head on. Licensing and regulation may be inevitable especially at the state level for locksmiths. This federal bill is merely one way to address a problem which will not go away. We encourage your readers to respond to your poll, and also to write to ALOA directly to voice their opinion, member and nonmember alike. We raised this issue at this time for precisely this purpose, to open it up for debate. Readers should take the time to really think about how they feel and then let us know. Don't just dismiss this proposal because of the misguided notions that "all regulation is bad" or "the government will have its hand in my pocket" or "the government can't do anything right." Rather give us the benefit of your learned, well thought out opinion. As always, we will respond to the needs and wishes of our members.§

Mosler Safe Parts

"Mosler dials and dial rings do not interchange with any other safe manufacturer. Their spindles on the dials are very particular."

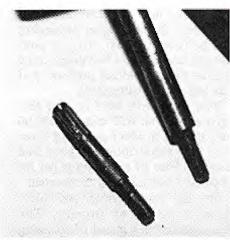

by Dale Libby

T here is enough information on the diabolical Mosler to fill volumes of safe books. I will touch on some of the more esoteric and mundane concepts, including the exciting Mosler relock trigger.

One of the most obvious abstractions about Mosler Safe is their practice of using Mosler parts exclusively. Their dials and dial rings do not exchange with any other safe maker. Their spindles on the dials are very particular, and they are not the cutting off kind. In other words, use the correct dial for the correct application, and that application only.

Other combination lock makers make dials with long spindles that can be cut on-the-job to fit a wide variety and assortment of lock applications. Mosler dials are ultra-specific, and the spindles are manufactured to set off relocking triggers. (See photograph 1.) For this article, we will touch on the Mosler relocking trigger, which is located in the combination lock case specifically.

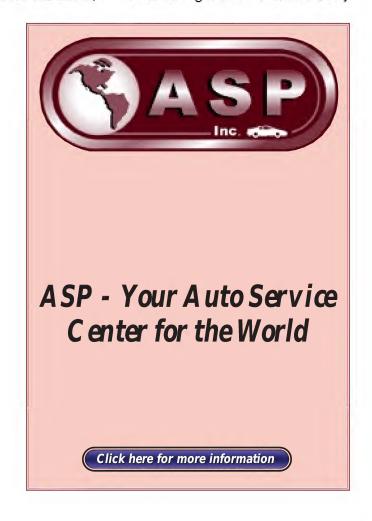

Other interesting elements will also be mentioned about the Mosler 302-402 series locks. At the ALOA convention,

1. Moster spindles are not cut to the same length as what most safe manufacturers use.

I was talking to a former safeman, only

NATIONAL

assembly, This amalgamation of split-

cam and ball bearing give the Mosler

MR lock the "click click" feeling when

the dial is turned past the drop-in area

of the lever. This "noise" efficiently

masks the drop-in area from would-be

manipulators. It also identifies the lock quite clearly with this unique, rare and

unusual "feel," even if the lock is not on

The National Locksmith

to find that some of the best known basic and rudimentary facts about this lock were a mystery to him. He had opened them in spite of lock of proper information. Perhaps, with more information, safecracking will be easier and more profitable.

Have you ever had trouble getting the double-winged spline key off the back of the drive cam? There is an easy solution for this. Just screw one of the back case cover screws into the hole in the center of the spline key. It is threaded to accept this screw, and it removes very effortlessly with little hassle. (See photograph 2.)

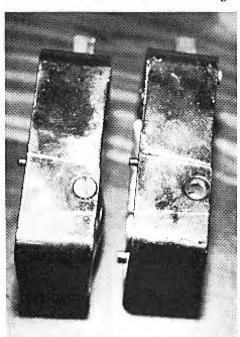

One method of attack on some safes, that is viable, is the drilling of the lever screw. This methodology of attack is to simply separate the lever from the combination lock bolt by drilling out the lever screw. When this happens, the bolt can be probed back under the

stationary lever and the safe opened.

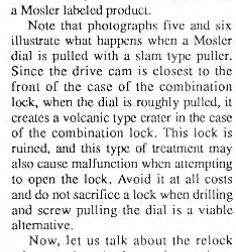

This method of attack will not work on the 302-402 locks. The locking lever on these locks is built into the lock bolt. Even if you drill off the lever screw, the bolt still could not be probed into the combination lock. The lever is in the lock bolt, and not above or below it as on other locks. (See photograph 3.)

There are a couple of differences between the MR (manipulation resistant) and the standard 302-402 locks. This first difference can be seen on the side of the case of the combination lock. On the MR lock there is a screw that can be clearly seen on one side of the lock. On the non-MR locks, there is an empty cavity. There is a spring and ball bearing assembly under the screw, which is very hard to remove. (See photograph 4.)

The second difference is a split drive cam that interacts with the ball bearing

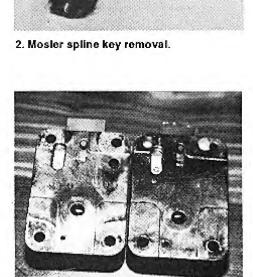

4. The M-R 302 is on the left and standard on the right. Note the screw on the left which houses a ball bearing.

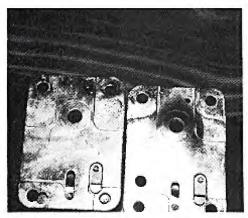

Now, let us talk about the relock trigger. A relocker trigger is a mechanism within the combination lock case itself, and is part of the lock. A relocking device is a separate

6. The M-R 302 is on the left, and a standard on the right. Note how the M-R lock case has been dented out due to slam-pulling the dial.

3. Note placement of the relock leaf spring and components. They are the same on both M-R and standard locks.

5. The combination lock case on the right has been slammed open.

7. Relock trigger pin is "floating" in a bed of solder.

NATIONAL

mechanism that lives outside the lock case. It is activated by forcible procedures of the lock being attacked by punching, torching, drilling, or a combination of all three.

There are two parts to the relock trigger mechanism. There is the lock bolt blocking part, and the case part. Let us take the case cover first.

On the cover, adjacent to the bolt screw guide, is a brass colored pin. It only sticks up about 3/16" or so. This pin pushes a corresponding pin in the lock case down when the cover is installed correctly. When the pin in the case is pushed down, it allows the lock bolt to move in and out freely.

If the cover of the lock is punched or becomes loose, this will allow the case pin to move out and relock the bolt. This problem can be neutralized by drilling and pulling the cover back in place, or by using a specific relock neutralizing tool through the spindle hole.

The cover also holds another nasty surprise. It also has a thermal relocking feature. Our pin is floating in a pool of solder material. (See photograph 7.) If heat is used to melt hardplate or to gain entrance to the lock case, this soft metal will melt resulting in the pin being pushed into the molten low heat

material as it is melted. (See photograph 8.) It does not take much to activate this thermal relock on the case cover.

The second part of the relock trigger is the trigger itself. On the outside of the lock one can see a flat piece of steel and spring mechanism. After removing the small flat head screw, a curved plate shim and oval flat spring can be removed. Under the spring is the brass

8. Solder has melted and the pin has moved.

relocking pin.

Simple in design, this pin is diabolical when activated. It has a large head with a long narrow shift which interacts with the case cover pin. When depressed, the small pin lets the bolt pass smoothly without any obstructions. If the relock trigger is activated, the large part of the pin moves into a cutout on the lock bolt, and keeps it from moving. Simple and effective.

How does one deactivate this trigger if it is set? First, determine if the trigger is set by dialing the combination. If the dial stops before the bolt is withdrawn, then it is a good bet that the trigger is set. If the bolt withdraws, but the handle will not turn, then a relocking device is set and that is another problem entirely.

After determining by feel that the relock trigger has been activated, you can neutralize it with special tools or drill it out with a 1/4" drill. The exact measurement for the relocker is 1-3/4" over from the center of the spindle along the centerline by 5/8" down. Be prepared for hardplate.

The centerline of the lock is determined by how the lock is mounted, Right hand (RH) on safes, and either vertical up (VU) or vertical down (VD) on money chests and other rated doors and GSA containers. §

Apex By Fort Lock

"The result of four years of effort is the Apex ® Tubular key lock which has uniquely designed tubular keys, and is highly resistant to forced attack."

Send your look and key questions to Jack Roberts, The National Locksmith, 1533 Burgundy Parkway, Streamwood, IL 60107.

by Jack Roberts

H istorically, there are two groups of people. In the one group there are those who own something. In the other group are those who want whatever it is that the first group owns but are not willing to pay the price to acquire it. The first group has worked methodically through the years to devise a means of protecting whatever it is that they own and the second group has worked just as hard to devise ways and means to defeat that protection.

High security is a term that has been employed extensively in recent years by well known lock and automobile manufacturers for the protection of property with terms such as unpickable, burglar proof, highly resistant to physical attack, etc. Yet someone, somewhere, is trying to develop a means to defeat each of these designs.

The Chubb, Bramah, and Newell were high security locks of the 1800's yet each of these were defeated by skilled hands of the period who devised tools for the task and I would guess that even today's locksmith, or burglar, would have a tough time with one of these locks. The introduction of the pin tumbler mechanism by Linus Yale in the mid 1880's created the need for new tools. The tension wrench and rake pick were born.

The principles of picking pin tumbler cylinders have been known and employed for many years. Get each pin to the shear line and the plug will turn. The "in-line" construction of pin tumbler cylinders permits this method of conquest with relative ease or with extreme difficulty depending on the skill of the manipulator and the construction of the cylinder.

Manufacturers countered picking skills with grooved pins, mushroom pins, etc, but maintained the in-line design of the pin chambers.

The Chicago Lock Co. started development of a round or tubular design for pin chambers in the early 1900s and in 1933 introduced the Ace tubular key cylinder. This was immediately received by the people in group one for the protection of their holdings and just as quickly the people in group two started to devise a tool that would defeat the design. Today we have a wide choice of tools, picks, saws, breakers, etc. for gaining entry into this type of cylinder.

With the expiration of patent rights other companies started to manufacture the tubular key cylinder and many variations of the original design have ensued. Off-set left, off-set right, dead pin, eight pin, pin within a pin, were developed to thwart the intruder, yet each new design has been met with a newly designed picking tool.

Typically, when picking a tubular key cylinder, a pin that will not move is in a bind and is not at the shear line. A pin that has movement is "picked" and is at the shear line. (See illustration 1.) This theory persists regardless of the pin configuration and although many manipulators often yield to the design, persistence of attack will cause the

Spring force
Spring force
Spring force
Upper cylinder

design to yield to the manipulator.

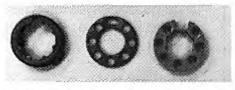

In the mid 1980's the Fort Lock Co., who has produced the Gem® tubular key lock for many years, undertook the challenge of developing a high security tubular key locking system. The services of David Lee, who for years had invented and manufactured picking and manipulative tools, were employed to exploit a design which would resist opening efforts by picking or impressioning. David's' commission was simple: design a cylinder that he could not defeat.

The result of four years of effort is the Apex® Tubular Key Lock which has uniquely designed tubular keys, is highly resistant to forced attack, does not yield to the most skilled picking efforts, will not reveal a code by impressioning, and has a four level program of key control.

The Apex® Level 2 key appears to be the same as conventional tubular keys but close examination reveals grooves which at first glance appear to be bittings. (See photograph 2.) These grooves, however, lay between the bitting cuts and allow the key to pass a hardened restrictor plate (see photograph 3) located just inside the face of the shell of the lock.

The Apex Lever 2 key. Note restrictor grooves.

From left to right: hardened restrictor plate, brake plate, another brake plate.

150 The National Locksmith

NATIONAL

This system of key control is known as profiling and allows the design of various levels of key control. Paracentric type keyways are designed with various wards which we know as sectionals. A master section key is then broached which will pass all the keyways of a given section.

The Apex® design is somewhat similar to sectionals in that the Apex® key will enter all existing Gem and Ace II keyways but conventional Gem and Ace keys will not enter the Apex® keyway. This design permits the Apex® to be keyed into an existing system with the Apex® key capable of operating all locks in the system but the existing keys will not enter or operate the Apex®

Nitrotec®, a widely used hardening process, is used on the keys for Level 2 and on the restrictor plate and is available for other critical parts of the Apex®, including the shell and spindle. Several ruined drill bits and saw blades which we used in the evaluation of the Apex® attest to the true hardness of Nirotec®.

The Apex ® 4 level registered key control program is designed to accommodate all security needs. Level I could be called the "locksmith level" in that standard tubular keys are used along with the pick resistant design of the Apex®, but without the profiling restrictor plate. Keys may be duplicated and locks assembled and combinated in the shop or in the field. This level would be applied to meet a customer demand for a highly pick resistant application.

Level 2 enables the locksmith to offer the customer the pick resistant Apex® design, hardened profile keys and restrictor plate and factory issued key control card.

The locksmith is issued pre-bitted keys and "0" bitted cylinders. Cylinders are combinated by the locksmith to the pre-bitted keys and the key control card is registered and given to the end user. Additional keys may be obtained from the locksmith with the properly signed and executed forms. No level 3 pre-bitted keys are available from the wholesaler or distributor. The quantity of keys required by the customer is placed with the original order and additional keys are obtained only through the process outlined for level 2.

Level 4 offers customer greater key control. The quantity of keys required is placed with the initial order and factory originated profile keys are provided after which all records of codes are destroyed. Level 4 replacement keys are not available under any circumstance.

Although the Apex® key control program is somewhat related to similar programs offered by other manufacturers, the application of this type of control to tubular key locks provides additional opportunities for the locksmith to expand into new markets. A group of keyed alike vending machines, for instance, could be serviced by the use of a conventional tubular key, but the cash or money box could only be opened with the Apex® key which, of course, could also be used for servicing the other compartments of a unit.

The pick resistance of the Apex® is accomplished by a unique design which incorporates two moveable parts within the cylinder, the #1 and #2 brake plates (see photograph 3) and seven more pins. Where the conventional tubular key lock has 14 pins, seven bottom or driver pins and seven top or combination pins, the Apex® has 21 pins. 14 of these pins are drivers and seven are top pins. (See photograph 4)

Although the pin layout in illustration five would appear to be a conventional masterpin layout, this is not the case. The pins in the bottom row, which contact the driver springs are lower driver pins. The pins in the

HPC has it all:
Key Machines, Software, Books, Car
Openers, Pick Sets, Tools, Door Guards,
and Key Cabinets

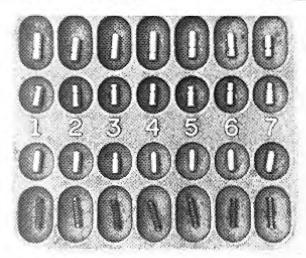

4. The 21 pin Apex layout.

center row are upper driver pins and the pins in the top are top or combination pins.

The brake plates and the upper drivers create multiple false shear lines within the lock or cylinder as shown in illustration five. Examining the pins in this sketch we can see that as torque is applied, the two movable brake plates clinch the upper and lower drivers. This clinching can occur at the shear line, below the shear line or above the shear line. All three of these conditions result in the picker feeling stiff pins. The Apex ® cylinder, therefore, does not

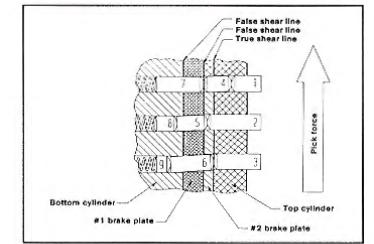

Illustration 5

reveal the cryptic message "A stiff pin equals a non-picked pin and a pin with freedom of motion equals a picked pin." The result is a cylinder that virtually cannot be decoded.

Examine the #1 and #2 brake plates in photograph four. There is a notch in the #1 brake plate and an elongated hole in the #2 brake plate. These openings are 4 mm wide into which a stop pin (brake reaction pin) in the bottom cylinder extends which limits the travel of the two brake plates to 2 mm left or 2 mm right. Note that all seven chambers may be picked to any of the multiple

shear lines giving false signals to the manipulator.

The complete Apex ® assembly, less springs and pins, is shown in photograph six. A level 1 cylinder would not have the hardened restrictor plate since conventional tubular keys are used at this level. Photograph seven shows the internal components, assembled and ready for insertion into the shell or housing.

In the cut-a-way, (see photograph 8), we can see the top cylinder, #2 brake plate, #1 brake plate and the bottom cylinder. The proper key is inserted and

The world's largest producer of automotive locks and keys.

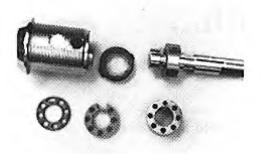

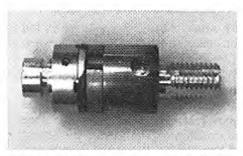

6. The complete Apex assembly.

7. Internal components of the Apex shown assembled.

8. Cutaway showing individual components.

all pins are at the true shear line. As an additional deterrent to physical attack, a breakaway groove is located in the nose of the spindle just above the top cylinder. (See photograph 7.) The breaker tool, designed for forced entry of a tubular key lock, will shear the spindle at this point making further attack impossible.

We find the Apex® design to be a truly innovative approach to high security for tubular key locks and must admit defeat in our efforts at manipulation and physical attack. David and the Fort Lock engineering staff did a number on this one.

Becoming A Locksmith...

"You should see this ad I found in Mechanics Illustrated while Harold was trimming my beard. It's like a prophesy or something!"

by Sara Probasco

P cople become locksmiths for a variety of reasons, most of which have little to do with putting bread on the table. I've never heard a locksmith say he entered the field to get rich. It's probably just as well.

A few locksmiths I've talked to grew up in the business crawling under their father's workbench while he worked, cutting their teeth on pins and springs, learning their shapes and numbers by sorting keys. Often, their first words were learned at their father's knee, technical names not commonly known by laymen, like the Golderned@*#*! ImportedJunk Lock, and the WellWhoLeftTheDagNabbed-ThingOpenInTheFirstPlace pinning kit.

Occasionally, these privileged children have been allowed to observe secret rituals, unseen by any but the most devout locksmith. Take the hammerlock dance, for example. After and time-consuming preparation, sometimes extending over a period of days, the locksmith finally tightens the lock in his vice, takes a small sledgehammer and, leaping up and down as he shouts an obscure chant, smashes the lock to bits. The smile on his face at the close of this ritual clearly displays the degree of satisfaction that may be derived from such exercises.

None of our children chose to follow Don in the locksmith business. I remember when one boy was a freshman in college, people asked, "Is he going to become a doctor? A lawyer? An engineer?" We were just hoping he'd become a sophomore.

But Don hasn't given up on the idea of passing the business down the family line. Just the other day, I watched him pick up one of our little grandsons and carry him around the shop, showing him first one thing, then another. Finally, they stopped before Don's work bench, piled high with its normal clutter. Everything was covered with a fine layer of graphite, as if Mt. St. Helen had erupted again, somewhere over in the corner.

Don said proudly, "Just think Jacob, someday all this could be yours,"

It took us three hours and several cookies to get the kid to stop crying.

Most of our children were out on their own before we entered locksmithing. Already we were looking forward to frittering away the emptynest years reading, traveling, doing exactly what we wanted to do, for a change.

Then, one day, Don frittered over to Harold's Barber Shop while I was working at home, constructing a stained glass panel. A few minutes later, he burst into the house, filled with excitement, "Guess what!" he said.

I took one look at his half-trimmed beard, and replied, "Your barber died?"

"I mean it. I thought of something I've wanted to do ever since I was a kid."

Strange, he'd never mentioned it before. "What made you think of it today, in the middle of a beard-trim?"

"Actually, I started thinking about it when I passed the Cut-Right Key Shop on the way to Harold's, a while ago."

"You mean that little outhouse on the grocery store parking lot? The one with the drive-up window on one side and the little old man who can barely turn around in there?"

"Right. But you ought to see it up close. It's a lot bigger on the inside than it is on the outside. Anyhow, the thing that really capped it off was this ad I found in Mechanics Illustrated while Harold was trimming my beard. It's like a prophecy, or something."

He waved a scrap of paper beneath

my nose. Across it, was scrawled something in his illegible handwriting. "Listen to this," he read. "Veterans, Factory Workers. Tired of punching someone else's time clock? Be your own boss. Learn to be a locksmith in 13 easy lessons. Send now for free information to The Locksmith School of Knowledge, Box 1234, Las Vegas, California. Isn't that great? It sounds like it was written just for me."

"What do you mean, written just for you?" I asked. "You're not a veteran or a factory worker. You've never punched a time clock in your life. Besides, you told me that after that last fiasco, you would never start your own business again."

"That's besides the point. This is different. This is something I've always wanted to do. Besides, we can work at it together." His eyes took on an unnatural gleam. "Can you imagine being paid to spend all day tinkering with locks?"

As a matter of fact, I couldn't. Here was the man I loved, who I thought was planning to IoII on the decks of an ocean liner with me for untold hours, who had said he wanted to get away from the rat-race and travel. This man, whom I decided I did not know at all, was now glibly talking about investing our hard-carned savings in a Mom and Pop 24-hour service business.

Suddenly the words of Albert Einstein buzzed through my brain. "If I had it to do all over again," he once said, "I would become a locksmith." I wondered what he had meant by that. Can't you just see Einstein writing technical manuals for locksmiths? Few can understand anything of what he wrote about relativity. What do you suppose he'd do to masterkeying?

I decided to smile sweetly and hope Don's idea would pass as quickly as it had come. But such was not to be the case. In a few weeks, we were the proud owners of a key machine, assorted key blanks, files, locks, pinning kits, and all the other paraphernalia that locksmiths require, along with a 4" educational /instructional manual. (Which, fortunately, was not authored by Albert Einstein.) The package arrived right after breakfast. Don carefully arranged everything neatly on the kitchen table and sat down to admire his stash.

When dinner time came, he was still sitting there, beaming.

"Honey, would you mind putting all that away so I can set the table?" I asked.

You would have thought I'd threatened to sell his oldest daughter to the Gypsies.

"Don't you touch a thing," he snarled, protectively hovering over the table. "This is my locksmith stuff."

"I know, dear, my dinner is almost ready."

"We'll eat out in the back yard," he replied.

Glancing out the glass door to the back yard, I said, "Then you'd better get out our parkas and start shoveling snow off the picnic table."

We didn't eat much dinner that night. I've learned since, that in the locksmith business, you eat chicken one day and feathers the next. So I guess it was good practice for us.

Upon completion of the correspondence course. Don realized he had only begun to scratch the surface of locksmithing, but his appetite had been whetted. He dove into an apprenticeship, then worked mobile for six years, and finally we opened a full-line retail shop with 24-hour mobile service.

Goodbye cruises to the Caribbean. Goodbye lolling around reading books and writing the great American novel, Goodbye visiting friends and family for long weekends. Goodbye to cooking for two weeks before the kids came over for the holidays.

HPC's ElectropickTM

"This product is a professional tool, requiring specialized knowledge. The Electropick will be a useful addition to your bag of tricks."

by Robert Sleveking

O ver the years, there have been a number of electric pick tools sold. Some were based on sound mechanical principles, and some were not. All were cumbersome to use and most had serious battery power problems. The development of longer lasting rechargeable batteries and smaller, more dependable rechargeable electric tools, have made it possible for HPC to develop the ElectropickTM.

This product is a professional tool, requiring specialized knowledge and a little experience to operate successfully. If you've been thinking about purchasing one, I'm sure you will find some interesting information in this article. By understanding the principles at work in the lock, and the operating procedures, you will have an easier time adjusting to this new tool. With a little practice, you may even find that the Electropick™ will become a very useful addition to your "bag of tricks."

What principle does the Electropick™ employ to defeat or manipulate pin tumbler locks? What are the adjustments and cautions that must be observed with this tool? What is happening inside the lock as the Electropick™ is used, and how do I achieve consistent success with it? What won't the Electropick™ do?

The basic physical principle that allows the Electropick™ to manipulate pin tumbler lock is very similar to the principle of the pick gun. With the pick gun, the pick tool "impacts" the bottom pins, each time the trigger is pulled, causing them to separate from the top pins, at the shear line. If the top pin jumps to the shear line and the bottom pin is below the shear line, the chamber is picked.

I'm sure we are all familiar with the puzzle or child's toy pictured in illustration one. A number of steel balls are suspended by a trapeze. If one ball is separated from the others and allowed to fall, as in the second

drawing in illustration one, it will strike the other balls. The energy invested in ball A, by lifting it above the others, is given up, as it strikes ball B. The energy in ball A is conveyed to ball B, which immediately couples the energy to ball C. The energy from ball A is communicated, from ball to ball, down the chain to ball G. As ball G receives the energy, it flys out from the other balls, as in the third drawing of illustration one, by approximately the same distance that ball A was lifted.

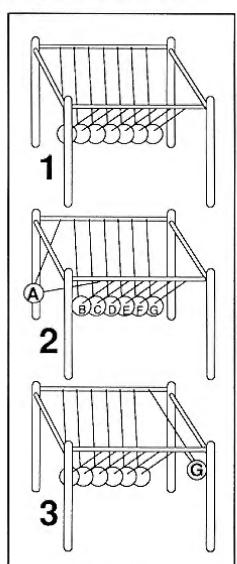

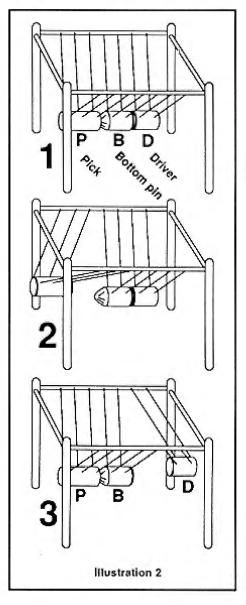

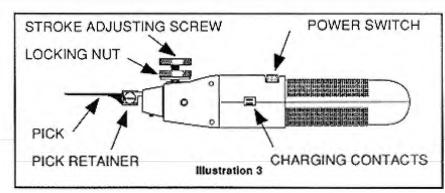

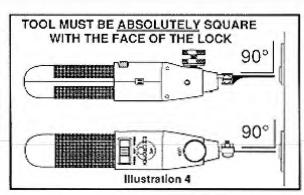

Illustration two brings this principle a little closer to the actual picking application. On this trapeze, we have a "P" pick, "B" bottom pin, and "D" driver. The pick allows us to impart a striking force, or impact, to the bottom pin. As the energy imparted by the pick is given up to the bottom pin, it is immediately coupled to the top pin, which is in direct contact with the bottom pin. The top pin will fly away from the bottom pin, against the pull of the gravity which holds it in contact

158 The National Locksmith

Illustration 1

with the bottom pin in the example. The amount of energy required to separate the bottom pin in our pins of a lock cylinder is determined by the tension of the cylinder springs.

The principle of impacting the pins of a lock cylinder to separate the top and bottom pins has seen great success with the lock gun. Though not appropriate for all applications, I have used one for a number of years with good results. The point of this explanation is to impress on you that the pick does not oscillate up and down or just wiggle the pins, it "strikes" them. With the pick gun, you could strike the pins as fast as you could pull the trigger. With the Electropick™, you can strike the bottom of the pins at about 120 impacts per second. (If I really try, I can get about three impacts per second with the pick gun.)

Illustration three shows the HPC ElectropickTM. The tool is shipped without the pick installed, so that will be the first thing you will want to do when you get it. If you have a pick gun, you will recognize the picks and pick retainer. The pick is held in place by a hardened #6 machine screw and nut. The soft aluminum retaining jaw is designed to prevent the screw from vibrating loose as the tool is operated.

Secure the pick in the tool as you see in illustration three. The power switch is mounted into the top of the handle of the tool. You will find that it has a neutral position that prevents accidental operation. The lock position of the switch is in the middle. Move the switch left or right and depress to operate the tool. Two large hand nuts on the top of the tool body adjust the stroke of the tip. The lower nut locks the adjustment.

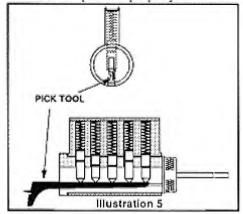

My first mistake, in using this tool, was not tightening the lock nut properly. As I buzzed away on a lock cylinder in the vise, the adjusting nut slowly crept out of the tool and tried to escape under the bench. Tighten the lock nut after adjusting the tool. I found that about 1/16" of tip travel was about

right for Weiser cylinders. More tip travel increases the violence of the impact, for cylinders with stronger springs.

Because this tool is rechargeable, it comes with a charging base. I thought it was a pretty convenient place to keep the tool. The charger base mounts to the wall, and the electrical contacts interlock with a positive snap, to prevent the tool from slipping. The wall mounting is ideal for above the bench.

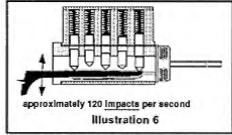

To give the tool a good overall test, we passed it around the shop, and everybody got a chance to pick some cylinders. Like a new toy, we all got to play with it. The biggest mistake we all made was in trying to "pick" the cylinders with the tip, instead of just letting the tool do its thing. If there had to be a rule for the ElectropickTM, it would be: "The tool picks the lock. You just hold the tool."

Illustration four makes a very important illustration that will determine your success with impact type picking tools. The tool must be absolutely square with the face of the lock. I don't know how to stress this more forcefully. As you insert the pick into the lock plug, it should slide "straight" into the keyway, as you can see in illustration five. If it rubs on the sides of the keyway, or is restricted by the wards, it will not work. If you are distorting or bending the tip, it is because you're not holding the tool "square" with the cylinder. If the tip becomes bent, it must be straightened before it will perform properly. You will

notice that there is no "diamond" or "ball" style tip. You don't need one. This pick method relies on "impact" or "shock" to drive the top pins above the shear line. Don't try to pick individual pins with it. Don't "wiggle" it like a rake or serpentine style pick. Just hold it straight and let it do its job.

Apply a light turning tension, with whatever style tension tool you prefer, I prefer to keep the tension tool at the top of the keyway. (The pins are always at the top of the keway, just in case your cylinder is mounted upside down.) Insert the tool carefully into the cylinder, trying not to touch the sides of the keyway. Of course you are going to touch the sides of the keyway, but this will keep you straight. Be careful not to touch the back of the keyway either. Touch the power switch to pick the lock. The tip will cause the pins to "dance" as in illustration six. A top pin that is not driven completely to the shear line will continue to be "impacted" by its bottom pin until it is inched up to the shear line. A top pin that picks immediately will simply be caught at the shear line. Note that I said caught and not "bound". Don't get carried away with too much turning tension. Light tension and gentle coaxing are still the watch words here.

As a little hint, you may want to "thin" the pick with a flat file a little to allow the tool to work freely in smaller keyways. Leave no sharp edges on the pick, or it will "eat" the warding in the keyway.

If you follow these instructions, you will get good results from this tool.

Abloy Security

"Abloy Disklock is as easy to install as any ordinary lock, and can be rekeyed in minutes onsite by qualified service personnel."

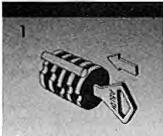

with a slogan that boasts, "Our strength is security," Abloy Security, Inc. is engaged in all facets of high security lock systems and designs. The company assembles, markets and services its own products. Over the course of more than 70 years. Abloy has forged a secure reputation on superb lock and lock cylinder technology. Adept in the science of security that led to the breakthrough design of the Abloy DiskLock® cylinder, and to the use of stronger materials, the company also owes its success to the art of total security.

The way they work with their clients to audit their security needs, and then rekeyed in minutes on-site by qualified personnel.

As the name suggests, it's the discs in the lock cylinders that separate the Abloy DiskLock® from conventional locking devices. These discs function like tumblers in a safe, ensuring that the lock is virtually pick-proof. Abloy guarantees against cross-openings in even the largest installations with about two billion theoretical combinations per keyway. Each key thus opens only the lock or locks for which it was designed. With the absence of the pins and springs found in other locks. Abloy DiskLock locks also possess greater resistance to wear. The hardened steel

cylinder resists drilling, hammering and other forms of attack.

Each person in a facility equipped with the Abloy DiskLock® system only needs one key designed specifically for that person's access level. One key can be equipped to open locks on front doors, display and showcases, offices and padlocks—even switches for elevators, alarms and electric garage doors. Yet each employee can open only a designated number of locks. Locks can be mastered (with all locks on one master key), sub-mastered (with several master keys, each opening locks in designated areas), or grand master keyed (opening all master keyed areas).

Key meets no resistance when inserted into keyway. There are no spring-loaded parts to wear out.

Only the correct key, when turned 90° will rotate the detainer discs to the correct position.

The locking bar can now enter the slot and allow the key to be turned to operate the lock.

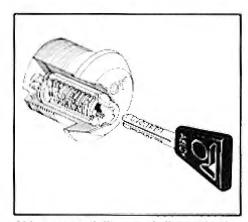

To withdraw the key, turn in the reverse direction until it stops. This will automatically scramble the detainer discs. The key meets no resistance when withdrawn from the keyway.

The four phases of the Abloy principle.

create complete security packages is the science and the art of security. Each Abloy security system is unique and tailored to individual requirements and specifications. For these reasons, Abloy attracts clients such as industries, institutions and agencies that have a great understanding of and need for high security.

While high security is important to these clients, some are also concerned with ease of use, flexibility and growth. An Abloy high security system can grow with individual requirements. The Abloy DiskLock® is as easy to install as any ordinary lock, and can be

Abloy patented discs work like tumbler's in a safe. The only way to open an Abloy cylinder is with the poroper key.

Keys can be uniquely colored and coded with raised dots allowing you to identify keys with just a glance or touch. Designated authorities with a registered Abloy code-card are the only personnel who can obtain additional keys.

The Abloy DiskLock® system is incorporated in a variety of types of locks. These include:

Deadbolt Locks. There are several models available with or without a keylockable thumbturn. A 2-inch hardened steel bolt protrudes a full inch and hardened steel balls make it jimmy-resistant. The cylinder is made of case-

160 The National Locksmith

NATIONAL AUTO LOCK SERVICE, INC.

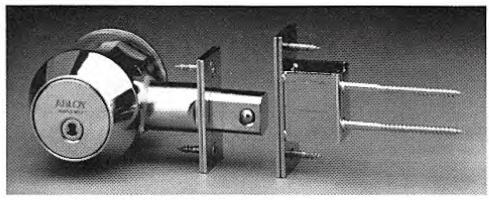

Abloy has several models of deadbolts available.

hardened steel, not only steel inserts.

Mortise and Mortise/Rim Cylinders are available in casehardened steel or brass and they fit standard mortise and rim locks, converting ordinary locks to high security ones.

Cabinet Locks. A full range of spring and bolt locks are available for glass, wood or metal cabinets.

Cam locks. Four standard cam locks are offered in two lengths. Cam movement ranges from 90 to 360 degrees and options include the ability to remove keys in locked or unlocked position.

Padlocks. These high security

thumbturn,

Flat Rim Cylinders. Designed to fit Abloy rim locks, flat rim cylinders are available in standard lengths and a variety of finishes.

Switch Locks. Made to restrict access to electrically controlled doors, alarm systems, elevators, parking garages, etc., these locks are available in spring-loaded momentary contact types and other functions.

Push Locks. Similar to cabinet locks, these are specifically designed for sliding wood or glass cabinet doors.

Oval Cylinders. These are identical in performance and security to other Abloy high security cylinders.

combinations.

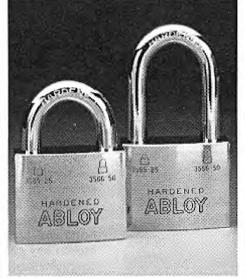

Abloy Security, Inc. now offers the AWI product line, including AcroLok cylinders and accessories, File •Guard™ locking bars and accessories, and Welch ™ cylinders, deadlocks, and accessories.

J. Flynn, Director of Business Development, says, "Abloy Security is the security specialist. We manufacture high security cylinders as well as the AWI cylinders which come in 20 keyways. These include mortise, rim, thumbturn, dummy as well as key-in-knob styles. The AWI cylinders are made in the USA, in Dallas, Texas."

J. goes on to note that, "Our future is committed to servicing the locksmith in everything from medium to high security. We want to hear from our customers about how our product performs and about how we can be an even better manufacturer for the locksmith. Any locksmith with any suggestions regarding our products should feel free to call me."

The company says that it is determined to provide top quality products. Abloy products feature typical Scandinavian high quality construction and design. And the AWI line offers

Abloy also offers the AWI product line.

padlocks with brass or hardened steel bodies deadlock toe and heel. The key is removable only when deadlocked. All are available in rekeyable form.

Key-in-knob Cylinders. Easy to install, these cylinders allow conversion of new or existing knobsets to an Abloy system, and they fit most standard key-in-knob locks.

Profile Cylinders. These fit most European locks as well as many others. Available in most extended lengths, they can be ordered in single and double cylinder, and cylinder with Specialized Locks. Where numbers warrant, Abloy can design and manufacture high security Abloy DiskLock® devices to customer specifications.

The Abloy Security Center is a dealer program which authorizes the locksmith to sell and service the Abloy product line. Participating locksmiths obtain their key machines directly from the factory. The program allows the locksmith to offer his customers a unique high security locking system with almost two billion possible

cylinders made of solid bar brass.

Also, there is now a rebate program underway for the AWI line of cylinders. The locksmith simply registers with the manufacturer and he can participate in the program, receiving a 25¢ rebate on each cylinder he purchases. The company states that the rebate program is to show appreciation for their customers.

Tools For The Beginner

"A tool box for your lock tools only is a good investment. A fishing tackle box works fine if it has two ledges with separations for smaller tools."

by Eugene Gentry

Gene Gentry is the newest regular writer for The National Locksmith. He is a recent member of the locksmithing community. Therefore, Gene is sensitive to the questions and problems so often encountered by those who are new to the profession.

If you are a beginning locksmith, we invite you to send your questions to Gene Gentry care of The National Locksmith at 1533 Burgundy Parkway, Streamwood, IL 60107. You should not expect an instant answer by return mail. However, he will use your letters to help provide him with ideas for articles in upcoming issues. In fact, your letter could be used in Gene's next article in a question and answer format.

Wherever the new locksmith decides to go to work, he will need tools of the trade. At some locksmith shops they will provide needed tools, but at others you are expected to have your own. For large corporations or institutions you will have your own tools and they will furnish any supplies.

If you go into business for yourself, the first thing on your list is a key machine. Some of the schools give you a duplicating key machine along with the training, and this is a good start. Your school key machine will last you until you have so much business that you find you need a heavy-duty, faster machine to keep up. My key machine was furnished by the school, and I mounted it on a plyboard with a handle, and added a D.C. motor. With this setup, I can take it anywhere.

This machine is simply designed and

has three cutters: one to duplicate, one to cut steel keys, and a code cutting wheel. It has a micrometer for depth adjustment, and a few months ago I added a spacing micrometer. Other smaller inexpensive key machines are duplicators only, but do a good job.

The new locksmith, as he scans the latest tool catalogs, will find scores of wonderful locksmith tools that he feels he can't live without. He will buy some of these tools without thinking, then find out he doesn't use them all, or some didn't work out to his expectations.

A tool box for your lock tools only is a good investment. A fishing tackle box works fine if it has two ledges with separations for smaller tools and space for larger tools underneath. You

A fishing tackle box makes a good locksmith toolbox.

A fully stocked locksmith toolbox.

probably already have a hammer, screwdrivers, hacksaw, etc. Keep these in another tool box.

You do need lock picking tools. I purchased a pick gun, which works well on many locks. You have to practice with this, and make sure it goes into the keyway straight. On impulse I bought two lock pick sets. One of the sets is now in a drawer, and out of the other I use only the rake, hook and the tension wrench, (Another locksmith passed on to me a tip to rock the rake when picking a lock, and it has produced good results). Remember, though, that lock picking is a very personal preference. You might have better luck with picks other than the ones I use. That's why they make so many different kinds. Following is a list of tools I keep in the lock tool box:

Top Section: Ring pliers, long tweezers, Kwikset cylinder removal tool, Weiser shim pick, cylinder cap remover, small drill bits, several pre-cut keys, small flat screwdriver, punch, spanner wrench, plug followers (four sizes), rod magnet, two inch flashlight, six power magnifier, small phillips screwdriver, key files, and pencil.

Middle Section: Bottle thread locker, warded lock pick set, assorted bolts and screws for locks, shims, broken key pullers, emory paper, gas cap rocker key, and plug spinner.

Lower Section: Pick gun, small steel hammer, four inch vice grip, micrometer, wedge, lubricant, pick set, needle nose pliers, dial caliper, key decoder, wing window openers, and otoscope.

Best Buys: Of all these tools the ones that have helped me the most are a two and a half power magnifier with head band, a cylinder key file with the dimensions of a key cut, pick gun, dial caliper and plug spinner. The otoscope I use a lot for reading wafer locks, reading combination locks, and checking locks for number of pins or for damage.

162 The National Locksmith

Other Tools: In your other tool box, along with the regular tools, it is wise to have a cord, and cordless drill with bits to drill out locks when all else fails. A hand drill is needed in case the cordless runs out of juice in the middle of a job. One useful tool is the cordless rotary tool similar to the Dremel or Craftsman. I use it to adjust the striker on a sagging door. Another useful, but not necessary tool is a bolt cutter.

Specialty Tools: If you install deadbolts, you will need either a professional deadbolt installation kit or a drill, bits, hole saw and markers.

If you decide to specialize in

Plus you can obtain the Foreign Auto Service books by Lynn Hawkins to learn about working on foreign cars. Do not neglect to obtain the right books because they offer an easy way to learn important information from the real experts.

This may sound like a lot of tools, however, they do not all have to be purchased at once. If finances are tight, buy them when you find you need them. You might have to miss a job because you don't have the right tool, but the next time it comes up you will be ready.

Along with the tools, there are two

Necessary tools for the basic locksmith toolbox.

automobile lock repair and openings, then a whole line of auto tools are needed. I do very little auto lock repair work, mostly because of lack of training, but I do get a commission for referring work to a locksmith who specializes in this area I do carry a few basic opening tools, just in case, and except for G.M., have had good luck picking the auto locks.

Another important part of your tool kit is the books and manuals you obtain. For example, the Car Entry Manual sold by this magazine does make most auto openings fast and easy. things that are necessary right from the beginning. The first is a pinning kit. For a starter, a good kit is a universal color-coded assortment; one that has a comparative chart inside the lid is very helpful. Secondly, you need key blanks. Some of the supply catalogs offer an assortment of key blanks. Purchase some of each of all the common domestic and foreign auto key blanks. Also buy a flat steel key assortment, and a combination house and padlock assortment. As your business picks up, fill in with needed blanks. §

Make Sargent & Greenleaf's Comptronic locks your choice for electronic safe locking solutions.

10 Ways To Improve Business

"Here are ten good ways to improve your locksmith business. If they sound like good, old fashioned common sense, that's because they are!"

by Robert Sieveking

read a very revealing letter the other day from one of our readers. He was unhappy about several things, but mostly because he felt that he wasn't receiving the "short cuts," "secrets" and "inside information" which would allow him to "get the edge" on his competition.

It is to this person that I must humbly offer the benefit of some hard learned lessons, in the hope that he might benefit from my experience. I do not offer this information to be critical, or as a statement that I have accomplished any great success, but simply as example of some of the tricks I have found that work. Sometimes experience must be lived to be truly understood, but it is always better to borrow experience than to buy

Of all the virtues that experience teaches, I expect that humility has to be the hardest learned. When you talk to the young locksmith, you can't help but be impressed by the apparent array of knowledge that he possesses. Having studied and memorized key numbering systems and masterkey progressions that seem almost inconceivable to the

Sadly, his experience hasn't kept pace with his knowledge. He has all the answers, the part numbers and specifications, but is unable to disassemble and reassemble even the simplest of locking mechanisms. He has a card in his wallet that shows, without a doubt, that his is a "master locksmith," but he hasn't manipulated his first safe, under actual everyday circumstances. He could not read a wafer lock to save himself, and he "doesn't do" mortise locks. The sad thing about superboy, is that he doesn't know that he doesn't know.

On the other hand, when you meet a real master locksmith, you are impressed by the fact that he is not trying to impress you with his

knowledge or experience. If you ask, you' il probably tell you he doesn't have all the answers. His work speaks far louder than his words or identification ever will. Having met a few of the "masters," I can only say, "Don't talk, listen." Your air of experience is as transparent as the king's new clothes.

Manipulation is not something you learn in two weeks, nor can real proficiency be demonstrated on mounted locks. It is learned through day-to-day experience. Reading wafer locks was a lesson in the Belsaw course that most of us completed as a part of becoming certified locksmiths, but there is an ocean of experience between completing a lesson and being proficient enough to apply the technique to everyday key making.

Passing a test or completing a course is a wonderful way of showing that you have taken the time to study or paid to be in a particular class, but it in no way makes you any more of a locksmith than another. When I went to college, I studied business. When I got out, I had all the answers. After nearly 20 years in business, all I have now is more questions. Did the degree make me a business man, or was it the 20 years of experience? I'm just satisfied to be accepted as a good locksmith and a successful businessman. Why not just leave it at that?

The next most important quality of a successful locksmith/businessman is his ability to listen. Since most of our business is contracted by telephone, the ability to come across as a good listener can make or break even the most qualified locksmith. The telephone is the lifeline of the locksmith trade. An emergency trade, installation and service area, and price quoting are all carried on over a telephone. Here are a few telephone etiquette tips:

1) Always try to answer your phone after the second ring, but before the third. By picking up the phone on the

first ring, you will startle the caller or seem too anxious. Let it ring too long and they may think you don't need their business or hang up.

Always answer the telephone in a professional manner, i.e., "This is Al's Lock and Key. May I help you?" or "Al's Lock and Key. This is Margaret. May I help you?" If I were calling a business, and they answered their telephone with "hello" or "yeah," I'd hang up without a word, thinking I'd reached a wrong number. Start your conversation on a professional level. Friendly is nice, but this is a business call. Ask the first and most important question: "May I help you?"

3) Maintain control of the conversation. You ask the questions to get the answers you need. Most customers will not answer your first question ("May I help you?") All they want to know is, "How much to open a car?" or "How much to make keys for my car?"

Start your conversation with "Yes Ma'am," or "Yes Sir." i.e., "Yes sir, what kind of car do you have?" You haven't answered his question, because you need more information. Once you give him what he wants, he'll hang up on you. All he wants to know is "how much." He called because he needs your service, but you will have to "actively" sell it to him. This in no way means trick or trap your customer. It simply means, "be tuned-in" to what he wants.

Tell him truthfully how soon you can have a truck at his location, Explain to him that the newer autos are extremely hard to open, and that inexperienced persons (i.e. police, tow truck drivers and parking lot attendants) can do serious damage to the auto if they are allowed to "see if they can open it."

After you find out the make and model of the car, whether or not they are trying to open it themselves, and where they are located, give the price. If they agree to have the work done, ask

164 The National Locksmith

for the phone they are calling from and return their call. After you have tried the number and reached your customer, get all of his important information (name, home address, home phone). Again, state your charge and ask if he will be paying by cash or charge. If he is going to use a charge card, get the number and expiration date. Call in the card to make sure it is good and to get an authorization number before you leave the shop.

If this is an emergency call, explain to the customer that as soon as the truck is dispatched, the charge is due. This means simply that once you leave, he cannot cancel the call. Don't race another locksmith to a customer address for a car opening or key job, but don't try to fool them by making promises you cannot keep, either. If you say you'll be there in 20 minutes, be there.

Accepting checks is up to your company policy. If you don't like their check, offer to follow them or better yet, take them to a money network machine. You should know that the customer is able to pay before you roll. Don't leave the details to be argued out in some dark street in front of the other person's family.

You'll bite the bullet if you trick the customer or try to trap them into extra charges or add-on prices. You'll get away with it a few times, but it will undermine your professional image and destroy your credibility in the community. I heard a statistic once that one dissatisfied customer will cost you seven sales, It sounds reasonable.

4. When quoting prices, don't underestimate what your customer can afford to pay. Don't quote a cheap lock, simply because you think that is all your customers can afford or are willing to pay. Quote a high and a medium priced "quality" lock. We don't sell low quality merchandise. We only have to apologize for the price once. If we sell cheap merchandise, we have to apologize for the poor quality forever.

Another way to say the same thing is to say, "We are forced to live with the bitter reality of poor quality long after the sweetness of the low price is forgotten." Sell on the merit of the quality of your "service." Service is the only thing that no one can compete with you on. It is also the only thing you have to sell, that you don't have to buy.

5. Do not predict the negative outcome of a sale. If you answer a call with the thought that the customer is calling "just for a price," you will not treat him (or her) as a prospective

customer. You will treat them as an inconvenience to your day. A customer is never an inconvenience. He is always the most important person in the world. Impress on your customers that you want to see that they get exactly the service that they want/need, at the most reasonable price, and in the most timely fashion. That's what sells service.

I have answered calls and given service at almost any hour of the day or night, at the convenience of anyone that was in need of my service. Never, have they been an inconvenience. (Well, almost never.) An axiom of business is that "Money is the fruit that is always ripe." How much can you afford to walk away from? Why?

6. Don't take failure or rejection personally. The customer/caller is upset when he calls, if you are answering an emergency call, understand this from the beginning, and you will understand why he is short and demanding. Remember, you control what he needs. Be courteous, professional, and anxious to see that the customer gets what he needs, but don't be hurt if he doesn't buy. Some people simply don't have the money. Others may have the money, but want to try "do-it-yourself" methods first.

To the do it yourselfers, you should explain the advantages of "professional service," and the liability or dangers of failure, because of their lack of specialized knowledge and tools. "Quality service is never cheap, and cheap service is seldom good." "We offer better service than our competition, that's why you may notice a slightly higher labor rate." "We have to pay our most qualified people better."

7. Don't carry tales, or tell stories about the competition, even if you know them to be true. You can't rise above the competition by standing on their failures. You have to stand on your own merit. Compete on a professional level. Stop worrying about how much your competitor is charging or whether or not he is a member of some self serving organization. "I am, by far, the best qualified locksmith in this area. Try my work, I'm sure you will agree."

Make your living doing what you want, and let your customers know that you not only enjoy what you're doing, buy enjoy helping them. This attitude will show, in the way you interact with your customers and in the quality of your work. That's what makes a business grow. If you intend to master this trade, you will have to enjoy what you're doing.

8. Don't gripe and grumble about everything from the weather to the price of key blanks. Be happy to have work. If you are working as a locksmith and feel that you need more money, then become a better locksmith. That's supply side economics. If you work more and produce better work, the money will come. You can't just demand more money or you won't work. The world will let you sit home. As it should. If you don't like the money, get another job. Just don't tell me its because there are too many locksmiths or because you can't compete with some new guy that's working out of his basement. Give more and better service if you want more money.

9. Specialize and professionalize. Don't be known as a jack of all trades and master of none. I've known locksmiths that mowed grass and operated a handyman service under the same business heading, because there simply wasn't enough locksmith work in their area. There are a number of businesses that blend right in with locksmithing. If you must have more than one service line to survive, then that's the way it has to be. But be known as a master of many trades, not just another Jack. Study your trade to be more than a handyman.

Do what you do, and pass on what you don't. There is no shame in passing up a job now and then. If you spend a day drilling a safe and lose four or five automotive calls, what have you gained? If you can open a safe in an hour and are confident in your ability, go for it. If not, refer or refuse the job.

10. Don't get involved with gimmicks, that make you pass up the "bread and butter" business. Don't get strung out on complicated security and electronic systems that are strictly "specialty" sales. If you already have a market for this type of system, it might be a money maker for you, but don't put a big investment into specialty sales that "might" happen. You might end up with a big stock of something that didn't sell.

Employees that are service people are the business. They either reflect your image and attitudes or they don't. They are your personal representatives. If they are clean, well groomed, courteous, knowledgeable and present the image you want your customers to see, they are assets. If they are lacking in any of the above areas, they are liabilities. If you can train them up, Continued on page 183

Marketing In The 90's

"Perhaps the most daunting challenge facing the manufacturers is recognizing that not all distributors are alike; they perform different functions."

by Sean DeForrest

n the 1990's, manufacturers and distributors will be facing a vast new array of complex marketing issues. These issues range from distribution strategies (To whom do I sell and through what channel?) organizational strategies (How best should my firm be structured?).

One of the most significant issues will be how manufacturer-distributor relationships are defined and who in the distribution channel will be responsible for providing which functions in the marketplace. Of equal importance is how manufacturers will price their products to distributors and how this pricing strategy will relate to the functions a distributor provides.

To better define the manufacturerdistributor relationship of the 1990's, firms will use many new methods and approaches, including:

Distributor Agreements. As channels become more complex and begin overlapping, manufacturers will need to gain better control of the markets. One tool to help control their market will be the distributor agreement. The distributor agreement will outline what specific functions a distributor is expected to perform and what channels (types of customers) a distributor is expected to sell. Such agreements will reduce channel conflict and clearly define roles between the manufacturer and distributor.

Market Joint Planning. Manufacturers have a tremendous opportunity to work with their distributors to decide what specific actions they expect from one another in the upcoming planning horizon. Specific tactics and goals can be

decided upon which will give each party a better understanding of his responsibilities. In addition, such planning sessions can establish mutual goals by which both parties can measure their successes. Such joint planning will truly create a 'partnership" between the manufacturer and distributor and lead to a win win relationship for both companies.

Distributor Manufacturers can also utilize a distributor as a "window" to the marketplace by forming a distributor council. This council can be used to solicit input from a distributor's perspective on a wide variety of topics such as new product introductions, promotional programs, literature requirements. and marketing approaches. In addition, a manufacturer can improve its own customer service response by receiving feedback on current operations.

Perhaps the most daunting challenge facing the manufacturers is recognizing that distributors are not all alike and that they perform different functions in the marketplace. This recognition of "functional" differences will play a significant role in manufacturer pricing strategies in the 1990's, Currently, most manufacturer pricing strategies are one-dimensional; that is, the pricing criteria is strictly based on volume. Unfortunately, this over rewards some customers who provide few functions to the market and under rewards others who supply a great deal of functions and services to the market.

There are two major reasons for this one-dimensional approach:

First, because of past anti-trust problems, the door hardware and security industry is terrified of making decisions that could unfairly discriminate against the customers. However, the current legal climate recognizes the right of manufacturers to define their markets and to design programs and pricing strategies to service these markets, as long as the programs are clearly defined and the 'rules" apply to all members fairly. This does not mean that manufacturers must offer the same programs to all members in a channel. Distributors perform different services (functions) and should be rewarded differently for those functions. The time is long overdue for manufacturers to realize that their markets are extremely fragmented and a one-dimensional pricing program is outdated and ineffective.

The second reason manufacturers have been reluctant to change their pricing strategies is that the concept of functional discounts is complex. It is much easier to adopt a one-dimensional approach because it excludes the need to define a customer group. However, the advantage of a pricing strategy which recognizes functional differences with distributors will have a profound impact on a company's overall strategy and, more importantly, his profitability to accounts.

For example, some distributors have intense marketing efforts with a high degree of field service available. Such companies may perform timeconsuming services such as product demonstrations and after-market servicing. Other distributors may supply a bare bones marketing effort relying on the manufacturer to pull the product through the channel. If the manufacturer values the intensive field service provided by the first distributor, he should develop programs that recognize this value. Unfortunately, most pricing strategies do not recognize any difference.

The 1990's will mark a continuous acceleration of the changes affecting this industry. It is time for manufacturers to better control their channels of distribution by establishing closer relationships with their distributors. In addition, manufacturers must re-evaluate their pricing strategies.

How To Sell Safes

by Don Jenson

Selling safes to your clients can be made easy by greeting your customer with the following statement as you hand them your business card: "I would like to thank you in advance for the opportunity to meet your security needs." By thanking the customer in advance, you establish a more relaxed atmosphere.

A customer is more likely to own a safe after your demonstration if he or she likes and trusts you. This greeting immediately establishes you as a professional and your customer senses that you are not just interested in selling them a product but truly interested in meeting their needs. This greeting encourages the customer to buy a safe at your business rather than buy it somewhere else.

The phrase "own a safe" implies we all hate to be sold, but we love to buy and once we buy, we refer to purchases in ownership terms. In other words, since consumers say they "own" this or that, use the word "own" instead of "buy" to increase safe sales.

Doctors, lawyers and Realtors do it. All professionals qualify their patients, clients and customers by asking the customer questions. If you ask the right questions correctly and orderly, you will then be able to meet the customer's needs and raise profits.

There are several questions the customer can be asked, but there are four questions that should be asked by the seller.

The first question is: What kind of safe do you own now? This is a question the customer can related to by assuming he is wise enough to own a safe and is looking for another or better safe. Safe ownership then appears to be normal rather than an unusual occurrence and this puts the customer closer to making a decision rather than simply considering a decision.

If the customer says he owns a particular brand of safe, you should respond to the statement with "excellent." If the customer has no safe, you reply with "excellent." This is to simply look for a place to start gathering information about the prospective buyer and begin solidifying the relationship with your customer. Your opinions about the product should be offered later when the customer asks

you for them.

The second question is: What do you like most about the safe you have now? Or in the likely occurrence that the customer does not have a safe, you ask: What do you like most about the safe(s) you have seen?

The answer to this question tells you the features the customer likes or is looking for and whether the customer has been shopping for safes. Now you know what to point out when it is your turn to talk,

The third question is: What would you alter or improve about the safe you have looked at? Or the question: What would you alter or improve about the safe(s) you have now? The answers you receive should tell you what the customer is looking for and also help you determine your customer's "hot button."

The fourth question is: Other than yourself, is there anyone else involved in the final decision? The answer should tell you whether the customer can decide alone or if you will have to speak to one or more other individuals about the decision.

This question prepares the customer to make a decision by establishing his decision making ability and the expectation of making a decision. If the customer is not the only decision maker, you then must pursue a second meeting early in your demonstration.

By asking the above questions, the customer will become encouraged to talk with you. You will then gain the information you need to make a sale, and if your customer likes and trusts you, he is more likely to own a safe bought from your business.

You should ask many questions, so that you can get closer to the customer's needs from the moment of meeting him, but using less time and energy in the process.

Try and let the customer talk but guide with the above questions. Proper greeting, qualifying and determining the customer's ability to make a buying decision will lead to more sales in your business.

Shop Talk

Helpful Questions and Answers

Written by all of the following authors: Dale Libby, Robert Sieveking, Dave McOmie, Shirl Schamp, Don O'Shall, and Jack Roberts.

Shop Talk answers readers questions on any locksmith related topic. Only letters judged to be of general interest will be published. We regret that we cannot answer individual letters. Because of the volume of mail, only those questions answered in the magazine will receive answers. Send your locksmith questions to Shop Talk: The National Locksmith, 1533 Burgundy Parkway, Streamwood, IL 60107.

Q: I have enclosed three photos of a padlock unearthed during a recent building evacuation project. You can just barely make out the Yale name on one side of the lock (See photographs 1,

1. A Yale padlock submitted for further information.

Top view of the lock showing the patent date.

3. Bottom view of the keyway of the lock.

2 and 3).

It is a warded lock and an Ilco 1332 blank could be modified and impressioned quite easily. The mechanism is in fine condition inside, the exterior shows signs of aging, with the exception of the brass rings which are in fine shape. What can you tell me about this padlock?

James E. Dike Massachusetts

A: Jim, your Yale padlock appears to a Model 8454 although it is difficult to tell for sure since you do not give any dimensions. It could be an 8414, 8434 or 8454. The list prices on these in 1925 were \$1.75, \$2.25 and \$2.50. From the location of the body rivets I'm going for the 8454.

This is a steel case and shackle with a brass plate, which you refer to as bands, at the top and bottom. This is one of the earlier Yale designs and the patent numbers refer to changes in the interior mechanism. The square logo was adopted by Yale around 1890 and used until the early 1940's when they went to the round type of logo. The piece that you have could have been manufactured any time during that 50 year period. There are 144 key changes for this lock which is a four lever and, as you mention, can be impressioned rather easily. The collector value for this lock in fine condition would not be much more than the retail price in 1925,

You may be interested in accquiring a copy of The National Locksmith Guide to Antique Padlocks which gives information on this and many other padlocks of the 1800's and early 1900's.

Thanks for writing to Shop Talk, Jim, but next time it would sure help if you (and all Shop Talk readers) would lay a ruler alongside your photos or give us a diagram with dimensions.

Q: Gentlemen, in the July 1990 issue of The National Locksmith magazine, Mr. Dale Libby refers to "speed manipulation" in opening the Mosler vaults. What does the term "speed manipulation" mean? (Yes, I am sure it means manipulation by some fast method, but what is the procedure?)

James A. Brashear, Jr. Alabama

A: Speed manipulation is a shortcut type of procedure where instead of feeling for both the right and left contact points (at the drop-in area), one uses just a single reading. This cuts down the time to manipulate a combination lock open.

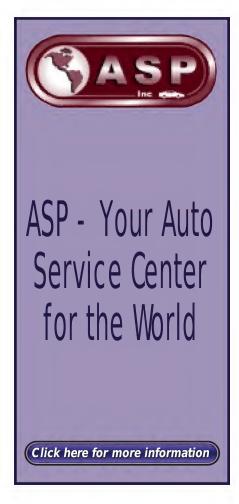

It is important to pick the correct contact point. There are two points in most combination locks, the left point and the right point. The different is one side is an acute drop off, almost a right angle, and the other side is a gradual angle drop off. The side with a sudden drop off gives a better "jump" in readings than that of a gradual and gentle slope.

On an S&G combination lock that is mounted in the right hand position we will determine the correct contact point. Assume that for a minute we can see the drive cam from the outside of the safe. Behind the dial with X-ray vision we can clearly see the drive cam. The sharp drop off side of the cam is to the left, while the slope is to the right.

Therefore, the correct contact point for this lock is the left contact point. To reach this point, however, one has to turn the dial to the right to have the nose of the lever contact the point. I know, I know, frontwards is backwards.

Another process in speed manipulation is to only break the dial increments into quarters, and eighth numbers at most. The correct and

December 179

standard manipulation procedure breaks the dial increments into tenths. This is too exacting for speed manipulation.

Before one can learn "speed manipulation" one must know standard combination lock manipultaion. Only with the honing of skills can one ever speed manipulate. Not all locks can be manipulated or speed manipulated open. Speed manipulation is just an advanced tool that can be used in specific instances where the lock and the manipulator are in perfect conjunction with each other.

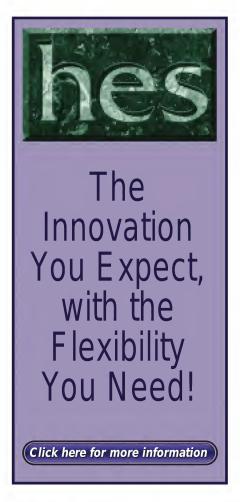

Q: I have been given a small, electronic safe which I cannot open. I don't know if the safe is malfunctioning or if I am now doing something wrong due to the fact that the internal battery has been removed.

The safe is approximately 15-1/2" x 11" x 10". It works on a 9 volt battery which is installed in the door. There is also a box which holds a 9 volt battery and a place to plug it in on the door in case the internal battery dies. The combination is set with four dials on the inside of the door.

It works by pressing the upper left button with the key on it. The little green light goes on. Then you enter the four letter combination. If the combination is correct, the motor retracts the bolts of which I believe there are two. If the combination is not correct, the red light comes on and remains on for about 18 seconds before it goes out. To lock the door, you press the lower left button with the !!!! on it. The motor then moves the bolts to the locked position.

Here is the short story. I originally set the combination, tested it, and locked the door. The owner later decided to see if the external battery pack worked so he opened the door, removed the internal battery, plugged in the external battery, closed the door and locked it. Now the safe will not unlock.

There are bolt holes through which I can look through to see the combination. The four dials are set to the combination I left them at. I can even reach in with a metal rod and manipulate the dials. I tried to center the dials as best I could, I changed the combination and I reset the combination and tried plus and minus one button for every combination. Nothing. The red light goes on telling me the combination is incorrect. I left the external battery plugged in

overnight in case there was some sort of timer. Same thing.

I cannot find anyone who knows anything about the safe or maker except that it is probably an import. The owner can give me absolutely no information either. I suspect there is some kind of preset combination which will always open the safe since it is meant for hotel rooms and you know how often often someone will forget their combination.

There is nothing valuable in the safe, but I'd like to know what the problem is and would appreciate any help.

> Ted Swirsky New Jersey

A: I have never worked on a safe that did not have a keypad and either a handle, key, or lever to actually open the boltwork. The safe in question is definitely a foreign visitor to our shores. from somewhere in the Orient, either Japan, Taiwan, or another country. I can guess what the problem is, however. On many of the keypads electronic safes that I have worked on, I have found that if the battery pack gets too low, the safe will mess up. If the customer continually tries to change the combination often, or if the door is slammed too much, the digital memory can become confused.

This is probably what happened when the customer removed the inside battery pack and tried it on the outside. If he happened to put the 9 volt battery contact in backwards, and if the circuit was made, even for a second, then that was enough to permanently scramble the electronic memory. Even the loss of the battery integrity could cause a malfunction.

The theory that there is one combination that can open the safe is probably a good one. Unless you can find the distributor of these safes, or possibly the hotel where the safe came from, there is no easy way to get this master override combination. In fact, I worked on a safe from American Express where the customer's combination would not work. I got the original factory override combination direct from the U.S. distributor, and that did not work either. So, that avenue of attack will not work.

On the safes with a handle, the units are blocked from moving by a solenoid. Dropping the safe on the front side a couple of times usually works to open these units.

To open your safe, I would try to remove any back cover screws through

the mounting holes of the safe. After removing the cover, try to get the bolt or bolts back inside the safe so the door will open. Also check for manufacturer labels or the American distributor of the safe.

Once you get the safe open, reacttach the internal battery and possibly the safe will open. Let the Shop Talk column know about what success you have.

Q: I recently purchased another shop's inventory, and I found a hook full of these keys. The seller told me that they were to an old car. Beats me.

I thought maybe somebody out there might know what it is to.

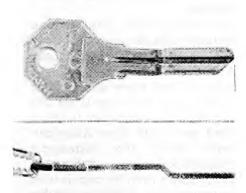

P.S. You can have the key, I've go plenty. (Not a big seller.) Looks like a lot of fun to cut too.

Stephen Eaton Ohio

A: You're right, they were a lot of fun to cut. That is why they were offset. They were a lot of fun to pick also. That's why they were called the Omega.

In 1933 and '34, the Chrysler Motor Company introduced the Omega High Security Ignition Lock. A steel "shutter" protected the keyway from dust and foreign material falling into the lock, but more importantly, it prevented the plug from being turned when the opening in the shutter was over the keyway.

The key you see in photograph four is offset so that it will allow the shutter to slide over the keyway with the key in the lock. In this position, the proper key will operate. This was a wafer lock.

4. Special offset key.

Code numbers were found on the passenger door lock cylinder and the ignition lock cylinder, if you could get it out. Because of the limited use of this key, you will find mostly original Yale blanks in old stock. Many of the key manufacturers of that time did not produce the Omega key. Curtis

produced the key with two millings, they were the Y-15 and Y-16.

The Yale Junior Omega key was found on:

Auto	Code Series	Key
1933 Chrysler	XC501 to 750	Y-15 or Y-16
1933 Dodge	XD001 to 250	Y-15 or Y-16
1933 Plymouth	XE251 to 500	Y-15 or Y-16
1933 Desoto	XS251 to 500	Y-15 or Y-16
1934 Chrylser	ZC0001 to 1000	Y-16
1934 Dodge	ZD1001 to 2000	Y-16
1934 Plymouth	ZP2001 to 3000	Y-16
1934 Dosoto	ZE3001 to 4000	Y-16

High security auto locks are not a new idea. This particular lock was billed as the patented pick-proof lock by Yale. The locks in 1934 were considerably better made than those produced in 1933.

The French borrowed a portion of the sliding shutter idea for the '76 to '79 Renault ignition locks that used the X-12 key profile. The hardened shutter slides left and right, as the Yale shutter did, to protect the keyway and actuate the locking column spring bolt. Removal of the key allowed the bolt to lock the tiller shaft. This safety feature prevented the wheel from locking until the key was completely removed from the cylinder.

The keys marked ZE probably are cut. I would expect that they fit a Desoto, which joined its ancestors long before you or I were born. I was told that it was possible to pick these locks, with special tools, but I can furnish very little other information for you §.
